

**Dell Command Line Reference Guide for the  
S4820T System  
9.8(0.0)**

# Notes, cautions, and warnings

-  **NOTE:** A NOTE indicates important information that helps you make better use of your computer.
-  **CAUTION:** A CAUTION indicates either potential damage to hardware or loss of data and tells you how to avoid the problem.
-  **WARNING:** A WARNING indicates a potential for property damage, personal injury, or death.

# About this Guide

This book provides information about the Dell Networking OS command line interface (CLI). This book also includes information about the protocols and features found in Dell Networking OS.

## References

For more information about your system, refer to the following documents:

- *Dell Networking OS Configuration Guides*
- *Installation and Maintenance Guides*
- *Release Notes*

## Objectives

This book is intended as a reference guide for the Dell Networking OS CLI commands, with detailed syntax statements, along with usage information and sample output.

 **NOTE:** For more information about when to use the CLI commands, refer to the *Dell Networking OS Configuration Guide* for your system.

## Audience

This book is intended for system administrators who are responsible for configuring or maintaining networks. This guide assumes that you are knowledgeable in Layer 2 and Layer 3 networking technologies.

## Conventions

This book uses the following conventions to describe command syntax.

<b>Keyword</b>	Keywords are in Courier font and must be entered in the CLI as listed.
<i>parameter</i>	Parameters are in italics and require a number or word to be entered in the CLI.
{X}	Keywords and parameters within braces must be entered in the CLI.
[X]	Keywords and parameters within brackets are optional.
x y	Keywords and parameters separated by a bar require you to choose one option.
x  y	Keywords and parameters separated by a double bar allows you to choose any or all of the options.

## Information Icons

This book uses the following information symbols:

**NOTE:** The Note icon signals important operational information.

**CAUTION:** The Caution icon signals information about situations that could result in equipment damage or loss of data.

**WARNING:** The Warning icon signals information about hardware handling that could result in injury.

## CLI Basics

This chapter describes the command line interface (CLI) structure and command modes. The Dell Networking operating software commands are in a text-based interface that allows you to use the launch commands, change command modes, and configure interfaces and protocols.

### Accessing the Command Line

When the system boots successfully, you are positioned on the command line in EXEC mode and not prompted to log in. You can access the commands through a serial console port or a Telnet session. When you Telnet into the switch, you are prompted to enter a login name and password.

```

Example          telnet 172.31.1.53
                   Trying 172.31.1.53...
                   Connected to 172.31.1.53.
                   Escape character is '^]'.
                   Login: username
                   Password: Dell>
  
```

After you log in to the switch, the prompt provides you with the current command-level information. For example:

Prompt	CLI Command Mode
Dell>	EXEC
Dell#	EXEC Privilege
Dell (conf) #	CONFIGURATION

 **NOTE:** For a list of all the command mode prompts, refer to the [Command Modes](#) section.

### Multiple Configuration Users

When a user enters CONFIGURATION mode and another user is already in CONFIGURATION mode, the Dell Networking operating software generates an alert warning message similar to the following:

```

Dell#conf

% Warning: The following users are currently configuring the system:

User "" on line console0
  
```

```
User "admin" on line vty0 ( 123.12.1.123 )
User "admin" on line vty1 ( 123.12.1.123 )
User "Irene" on line vty3 ( 123.12.1.321 )
Dell#conf
```

When another user enters CONFIGURATION mode, Dell Networking OS sends a message similar to the following:

```
% Warning: User "admin" on line vty2 "172.16.1.210" is in configuration
```

In this case, the user is "admin" on vty2.

## Obtaining Help

As soon as you are in a command mode there are several ways to access help.

**To obtain a list of keywords at any command mode:** Type a ? at the prompt or after a keyword. There must always be a space before the ?.

**To obtain a list of keywords with a brief functional description:** Type `help` at the prompt.

**To obtain a list of available options:** Type a keyword and then type a space and a ?.

**To obtain a list of partial keywords using a partial keyword:** Type a partial keyword and then type a ?.

**Example** The following is an example of typing `ip ?` at the prompt:

```
Dell(conf)#ip ?
access-list      Named access-list
as-path          BGP autonomous system path filter
community-list  Add a community list entry
domain-list     Domain name to complete unqualified host
name
domain-lookup   Enable IP Domain Name System hostname
translation
domain-name     Define the default domain name
fib             FIB configuration commands
ftp            FTP configuration commands
host           Add an entry to the ip hostname table
max-frag-count  Max. fragmented packets allowed in IP re-
assembly
multicast-routing Enable IP multicast forwarding
name-server     Specify address of name server to use
pim Protocol    Independent Multicast
prefix-list     Build a prefix list
```

radius	Interface configuration for RADIUS
redirect-list	Named redirect-list
route	Establish static routes
scp	SCP configuration commands
source-route	Process packets with source routing header
options	
ssh	SSH configuration commands
tacacs	Interface configuration for TACACS+
telnet	Specify telnet options
tftp	TFTP configuration commands
trace-group	Named trace-list
trace-list	Named trace-list
Dell(conf)#ip	

When entering commands, you can take advantage of the following timesaving features:

- The commands are not case-sensitive.
- You can enter partial (truncated) command keywords. For example, you can enter `int teng 1/1` for the `interface tengigabitethernet 1/1` command.
- To complete keywords in commands, use the TAB key.
- To display the last enabled command, use the up Arrow key.
- Use either the Backspace key or Delete key to erase the previous character.
- To navigate left or right in the Dell Networking OS command line, use the left and right Arrow keys.

The shortcut key combinations at the Dell Networking OS command line are as follows:

Key Combination	Action
CNTL-A	Moves the cursor to the beginning of the command line.
CNTL-B	Moves the cursor back one character.
CNTL-D	Deletes the character at the cursor.
CNTL-E	Moves the cursor to the end of the line.
CNTL-F	Moves the cursor forward one character.
CNTL-I	Completes a keyword.
CNTL-K	Deletes all the characters from the cursor to the end of the command line.
CNTL-L	Re-enters the previous command.
CNTL-N	Returns to the more recent commands in the history buffer after recalling commands with Ctrl-P or the up Arrow key.
CNTL-P	Recalls commands, beginning with the last command.
CNTL-R	Re-enters the previous command.
CNTL-U	Deletes the line.
CNTL-W	Deletes the previous word.
CNTL-X	Deletes the line.
CNTL-Z	Ends continuous scrolling of the command outputs.
Esc B	Moves the cursor back one word.

Key Combination	Action
Esc F	Moves the cursor forward one word.
Esc D	Deletes all the characters from the cursor to the end of the word.

## Navigating the CLI

Dell Networking OS displays a CLI prompt comprised of the host name and CLI mode.

- Host name is the initial part of the prompt and is "Dell" by default. You can change the host name with the `hostname` command.
- CLI mode is the second part of the prompt and reflects the current CLI mode. For a list of the Dell Networking OS command modes, refer to the command mode list in the [Accessing the Command Line](#) section.

The CLI prompt changes as you move up and down the levels of the command structure. Starting with CONFIGURATION mode, the command prompt adds modifiers to further identify the mode. For more information about command modes, refer to the [Command Modes](#) section.

## Using the Keyword `no` Command

To disable, delete or return to default values, use the `no` form of the commands.

For most commands, if you type the keyword `no` in front of the command, you disable that command or delete it from the running configuration. In this guide, the `no` form of the command is described in the Syntax portion of the command description.

## Filtering `show` Commands

To find specific information, display certain information only or begin the command output at the first instance of a regular expression or phrase, you can filter the display output of a `show` command.

When you execute a `show` command, and then enter a pipe (`|`), one of the following parameters, and a regular expression, the resulting output either excludes or includes those parameters.

 **NOTE:** Dell Networking OS accepts a space before or after the pipe, no space before or after the pipe, or any combination. For example: `Dell#command | grep gigabit |except regular-expression | find regular-expression`

<b>except</b>	displays only the text that does not match the pattern (or regular expression)
<b>find</b>	searches for the first occurrence of a pattern

<b>grep</b>	displays text that matches a pattern. The <code>grep</code> command option has an <code>ignore-case</code> suboption that makes the search case-insensitive. For example, the commands:
<b>show run   grep Ethernet</b>	returns a search result with instances containing a capitalized "Ethernet," such as <code>interface TenGigabitEthernet 1/1</code>
<b>show run   grep ethernet</b>	does not return the previous search result because it only searches for instances containing a noncapitalized "ethernet"
<b>show run   grep Ethernet ignore-case</b>	returns instances containing both "Ethernet" and "ethernet"
<b>no-more</b>	does not paginate the display output
<b>save</b>	copies the output to a file for future use

## Displaying All Output

To display the output all at once (not one screen at a time), use the `no-more` option after the pipe. This operation is similar to the `terminal length screen-length` command except that the `no-more` option affects the output of just the specified command. For example: `Dell#show running-config | no-more`.

## Filtering the Command Output Multiple Times

You can filter a single command output multiple times. To filter a command output multiple times, place the `save` option as the last filter. For example: `Dell# command | grep regular-expression | except regular-expression | grep other-regular-expression | find regular-expression | no-more | save`.

## Enabling Software Features on Devices Using a Command Option

This capability to activate software applications or components on a device using a command is supported on the S4810, S4820T, and S6000, platforms.

Starting with Release 9.4(0.0), you can enable or disable specific software functionalities or applications that need to run on a device by using a command attribute in the CLI interface. This capability enables effective, streamlined management and administration of applications and utilities that run on a device. You can employ this capability to perform an on-demand activation or turn-off of a software component or protocol. A feature configuration file that is generated for each image contains feature names denotes whether this enabling or disabling method is available for such features. In 9.4(0.0), you can enable or disable the VRF application globally across the system by using this capability.

You can activate VRF application on a device by using the `feature vrf` command in CONFIGURATION mode.

 **NOTE:** The `no feature vrf` command is not supported on any of the platforms.

To enable the VRF feature and cause all VRF-related commands to be available or viewable in the CLI interface, use the following command. You must enable the VRF feature before you can configure its related attributes.

```
Dell(conf)# feature vrf
```

Based on whether VRF feature is identified as supported in the Feature Configuration file, configuration command `feature vrf` becomes available for usage. This command will be stored in running-configuration and will precede all other VRF-related configurations.

 **NOTE:** The MXL and Z9000 platforms currently do not support VRF. These platforms support only the management and default VRFs, which are available by default. As a result, the **feature vrf** command is not available for these platforms.

To display the state of Dell Networking OS features:

```
Dell#show feature
```

#### Example of show feature output

For a particular target where VRF is enabled, the show output is similar to the following:

```
Feature State
-----
VRF          enabled
```

## feature vrf

Enable the VRF application on a switch. After you enable the VRF feature, you cannot deactivate it.

### S4820T

<b>Syntax</b>	<code>feature vrf</code>
<b>Defaults</b>	Disabled
<b>Command Modes</b>	CONFIGURATION
<b>Command History</b>	<b>Version 9.5(0.0)</b> Introduced on the Z9500. <b>Version 9.4(0.0)</b> Introduced on the S4810, S4820T, S5000, and S6000.
<b>Usage Information</b>	You can activate VRF application on a device by using the <code>feature vrf</code> command in CONFIGURATION mode. The <code>no feature vrf</code> command is not supported on any platform.

## show feature

Verify the status of software applications, such as VRF, that are activated and running on a device.

### S4820T

<b>Syntax</b>	<code>show feature</code>
<b>Command Modes</b>	EXEC EXEC Privilege
<b>Command History</b>	<b>Version 9.4(0.0)</b> Introduced on the S4810, S4820T, and S6000.
<b>Usage Information</b>	You can activate VRF application on a device by using the <code>feature vrf</code> command in CONFIGURATION mode. The <code>no feature vrf</code> command is not supported on any of the platforms.
<b>Example</b>	<pre>Dell#show feature Feature State ----- VRF          enabled</pre>

## Command Modes

To navigate and launch various CLI modes, use specific commands. Navigation to these modes is described in the following sections.

### BGP ADDRESS-FAMILY Mode

To enable or configure IPv4 for BGP, use BGP ADDRESS-FAMILY mode. For more information, refer to [Border Gateway Protocol IPv4 \(BGPv4\)](#).

To enable or configure IPv6 for BGP, use BGP ADDRESS-FAMILY mode.

To enter BGP ADDRESS-FAMILY mode:

1. Verify that you are logged in to ROUTER BGP mode.
2. Enter the command `address-family`
3. Enter the protocol type.
  - For IPv4, enter `ipv4 multicast`. The prompt changes to include (conf-router\_bgp\_af) for IPv4.
  - For IPv6, enter `ipv6 unicast`. The prompt changes to include (conf-router\_bgpv6\_af) for IPv6.

### CLASS-MAP Mode

To create or configure a class map, use CLASS-MAP mode. For more information, refer to [Policy-Based QoS Commands](#).

To enter CLASS-MAP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `class-map` command then enter the class map name. The prompt changes to include (config-class-map).

You can return to CONFIGURATION mode by using the `exit` command.

## CONFIGURATION Mode

In EXEC Privilege mode, use the `configure` command to enter CONFIGURATION mode and configure routing protocols and access interfaces.

To enter CONFIGURATION mode:

1. Verify that you are logged in to EXEC Privilege mode.
2. Enter the `configure` command. The prompt changes to include (conf).

From this mode, you can enter INTERFACE mode by using the `interface` command.

## CONTROL-PLANE Mode

To manage control-plane traffic, use CONTROL-PLANE mode. For more information, refer to [Control Plane Policing \(CoPP\)](#).

To enter CONTROL-PLANE mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `control-plane-cpuqos` command. The prompt changes to include (conf-control-cpuqos).

You can return to CONFIGURATION mode by using the `exit` command.

## DCB POLICY Mode

To enable and configure a Data Center Bridging (DCB) input or output policy, use DCB POLICY mode. For more information, refer to [Data Center Bridging \(DCB\)](#).

To enter DCB POLICY mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. To enable or configure a DCB input policy, enter the `dcb-input` command then enter the policy name. To enable or configure a DCB output policy, enter the `dcb-output` command then enter the policy name. The prompt changes to include (conf-dcb-in) for an input policy or (conf-dcb-out) for an output policy.

You can return to CONFIGURATION mode by using the `exit` command.

## DHCP Mode

To enable and configure Dynamic Host Configuration Protocol (DHCP), use DHCP mode. For more information, refer to [Dynamic Host Configuration Protocol \(DHCP\)](#).

To enter DHCP mode:

1. Verify that you are logged in to CONFIGURATION mode.

2. Enter the `ip dhcp server` command. The prompt changes to include (config-dhcp). You can return to CONFIGURATION mode by using the `exit` command.

## DHCP POOL Mode

To create an address pool, use DHCP POOL mode. For more information, refer to [Dynamic Host Configuration Protocol \(DHCP\)](#).

To enter DHCP POOL mode:

1. Verify that you are logged in to DHCP mode.
2. Enter the `pool` command then the pool name. The prompt changes to include (config-dhcp-pool-name).

You can return to DHCP mode by using the `exit` command.

## ECMP GROUP Mode

To enable or configure traffic distribution monitoring on an ECMP link bundle, use ECMP GROUP mode. For more information, refer to [ecmp\\_overview](#).

To enter ECMP GROUP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `ecmp-group` command then enter the ECMP group ID. The prompt changes to include (conf-ecmp-group-ecmp-group-id).

You can return to CONFIGURATION mode by using the `exit` command.

## EIS Mode

To enable or configure Egress Interface Selection (EIS), use EIS mode.

To enter EIS mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `management egress-interface-selection` command. The prompt changes to include (conf-mgmt-eis).

You can return to CONFIGURATION mode by using the `exit` command.

## EXEC Mode

When you initially log in to the switch, by default, you are logged in to EXEC mode. This mode allows you to view settings and enter EXEC Privilege mode, which is used to configure the device.

When you are in EXEC mode, the `>` prompt is displayed following the host name prompt, which is "Dell" by default. You can change the host name prompt using the `hostname` command.

 **NOTE:** Each mode prompt is preceded by the host name.

## EXEC Privilege Mode

The `enable` command accesses EXEC Privilege mode. If an administrator has configured an "Enable" password, you are prompted to enter it.

EXEC Privilege mode allows you to access all the commands accessible in EXEC mode, plus other commands, such as to clear address resolution protocol (ARP) entries and IP addresses. In addition, you

can access CONFIGURATION mode to configure interfaces, routes and protocols on the switch. While you are logged in to EXEC Privilege mode, the # prompt is displayed.

## EXTENDED COMMUNITY LIST Mode

To enable and configure a BGP extended community, use EXTENDED COMMUNITY LIST mode.

To enter EXTENDED COMMUNITY LIST mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `ip extcommunity-list` command then a community list name. The prompt changes to include (conf-ext-community-list).

You can return to CONFIGURATION mode by using the `exit` command.

## FRRP Mode

To enable or configure Force10 Resilient Ring Protocol (FRRP), use FRRP mode. For more information, refer to [Force10 Resilient Ring Protocol \(FRRP\)](#).

To enter FRRP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `protocol frrp` command then the ring ID. The prompt changes to include (conf-frrp-ring-id).

You can return to CONFIGURATION mode by using the `exit` command.

## INTERFACE Mode

Use INTERFACE mode to configure interfaces or IP services on those interfaces. An interface can be physical (for example, a Gigabit Ethernet port) or virtual (for example, the Null interface).

To enter INTERFACE mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `interface` command and then enter an interface type and interface number that is available on the switch.

The prompt changes to include the designated interface and slot/port number. For example:

Prompt	Interface Type
Dell (conf-if) #	INTERFACE mode
Dell (conf-if-gi-0/0) #	Gigabit Ethernet interface then the slot/port information
Dell (conf-if-te-0/0) #	Ten-Gigabit Ethernet interface then slot/port information
Dell (conf-if-fo-0/0) #	Forty-Gigabit Ethernet interface then slot/port information
Dell (conf-if-lo-0) #	Loopback interface number

Prompt	Interface Type
<code>De11 (conf-if-nu-0) #</code>	Null Interface then zero
<code>De11 (conf-if-po-0) #</code>	Port-channel interface number
<code>De11 (conf-if-vl-0) #</code>	VLAN Interface then VLAN number (range 1–4094)
<code>De11 (conf-if-ma-0/0) #</code>	Management Ethernet interface then slot/port information
<code>De11 (conf-if-tu-0) #</code>	Tunnel interface then tunnel ID.
<code>De11 (conf-if-range) #</code>	Designated interface range (used for bulk configuration).

## IP ACCESS LIST Mode

To enter IP ACCESS LIST mode and configure either standard or extended access control lists (ACLs), use the `ip access-list standard` or `ip access-list extended` command.

To enter IP ACCESS LIST mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Use the `ip access-list standard` or `ip access-list extended` command. Include a name for the ACL. The prompt changes to include (conf-std-nacl) or (conf-ext-nacl).

You can return to CONFIGURATION mode by using the `exit` command.

## ISIS ADDRESS-FAMILY Mode

To enable or configure IPv6 for ISIS, use ISIS ADDRESS-FAMILY mode. For more information, refer to [Intermediate System to Intermediate System \(IS-IS\)](#).

To enter ISIS ADDRESS-FAMILY mode:

1. Verify that you are logged in to ROUTER ISIS mode.
2. Enter the command `address-family ipv6 unicast`. The prompt changes to include (conf-router\_isis-af\_ipv6).

## LLDP Mode

To enable and configure Link Layer Discovery Protocol (LLDP), use LLDP mode. For more information, refer to [Link Layer Discovery Protocol \(LLDP\)](#).

To enter LLDP mode:

1. To enable LLDP globally, verify that you are logged in to CONFIGURATION mode. To enable LLDP on an interface, verify that you are logged in to INTERFACE mode.
2. Enter the `protocol lldp` command. The prompt changes to include (conf-lddp) or (conf-if-interface-lddp).

## LLDP MANAGEMENT INTERFACE Mode

To enable and configure Link Layer Discovery Protocol (LLDP) on management interfaces, use LLDP MANAGEMENT INTERFACE mode.

To enter LLDP MANAGEMENT INTERFACE mode:

1. Verify that you are logged in to LLDP mode.
2. Enter the `management-interface` command. The prompt changes to include `(conf-lldp-mgmtlf)`.

## LINE Mode

To configure the console or virtual terminal parameters, use LINE mode.

To enter LINE mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `line` command. Include the keywords `console` or `vtty` and their line number available on the switch. The prompt changes to include `(config-line-console)` or `(config-line-vty)`.

You can exit this mode by using the `exit` command.

## MAC ACCESS LIST Mode

To enter MAC ACCESS LIST mode and configure either standard or extended access control lists (ACLs), use the `mac access-list standard` or `mac access-list extended` command.

To enter MAC ACCESS LIST mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Use the `mac access-list standard` or `mac access-list extended` command. Include a name for the ACL. The prompt changes to include `(conf-std-macl)` or `(conf-ext-macl)`.

You can return to CONFIGURATION mode by using the `exit` command.

## MONITOR SESSION Mode

To enable and configure a traffic monitoring session using port monitoring, use MONITOR SESSION mode. For more information, refer to [Port Monitoring](#).

To enter MONITOR SESSION mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `monitor session` command then the session ID. The prompt changes to include `(conf-mon-sess-sessionID)`.

## MULTIPLE SPANNING TREE (MSTP) Mode

To enable and configure MSTP, use MULTIPLE SPANNING TREE mode. For more information, refer to [Multiple Spanning Tree Protocol \(MSTP\)](#).

To enter MULTIPLE SPANNING TREE mode:

1. Verify that you are logged in to CONFIGURATION mode.

2. Enter the `protocol spanning-tree mstp` command. The prompt changes to include (conf-mstp).

You can return to CONFIGURATION mode by using the `exit` command.

## OPENFLOW INSTANCE Mode

To enable and configure OpenFlow instances, use OPENFLOW INSTANCE mode.

To enter OPENFLOW INSTANCE mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `openflow of-instance` command then the OpenFlow ID number of the instance you want to create or configure. The prompt changes to include (conf-of-instance *of-id*).

You can return to the CONFIGURATION mode by entering the `exit` command.

## Per-VLAN SPANNING TREE (PVST+) Plus Mode

To enable and configure the Per-VLAN Spanning Tree (PVST+) protocol, use PVST+ mode. For more information, refer to [Per-VLAN Spanning Tree Plus \(PVST+\)](#).

 **NOTE:** The protocol name is PVST+, but the plus sign is dropped at the CLI prompt.

To enter PVST+ mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `protocol spanning-tree pvst` command. The prompt changes to include (conf-pvst).

You can return to CONFIGURATION mode by using the `exit` command.

## PORT-CHANNEL FAILOVER-GROUP Mode

To configure shared LAG state tracking, use PORT-CHANNEL FAILOVER-GROUP mode. For more information, refer to [Port Channel Commands](#).

To enter PORT-CHANNEL FAILOVER-GROUP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `port-channel failover-group` command. The prompt changes to include (conf-po-failover-grp).

You can return to CONFIGURATION mode by using the `exit` command.

## PREFIX-LIST Mode

To configure a prefix list, use PREFIX-LIST mode.

To enter PREFIX-LIST mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `ip prefix-list` command. Include a name for the prefix list. The prompt changes to include (conf-nprefixl).

You can return to CONFIGURATION mode by using the `exit` command.

## PRIORITY GROUP Mode

To create an ETS priority group, use PRIORITY GROUP mode. For more information, refer to [ETS Commands](#).

To enter PRIORITY GROUP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `priority-group` command then the group name. The prompt changes to include (conf-pg).

You can return to CONFIGURATION mode by using the `exit` command.

## PROTOCOL GVRP Mode

To enable and configure GARP VLAN Registration Protocol (GVRP), use PROTOCOL GVRP mode. For more information, refer to [GARP VLAN Registration \(GVRP\)](#).

To enter PROTOCOL GVRP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `protocol gvrp` command. The prompt changes to include (config-gvrp).

You can return to CONFIGURATION mode by using the `exit` command.

## QOS POLICY Mode

To configure ETS bandwidth allocation and scheduling for priority traffic, use QOS POLICY mode. For more information, refer to [ETS Commands](#).

To enter QOS POLICY mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `qos-policy-output` command, then the policy name, then `ets`. The prompt changes to include (conf-qos-policy-out-ets).

You can return to CONFIGURATION mode by using the `exit` command.

## RAPID SPANNING TREE (RSTP) Mode

To enable and configure RSTP, use RSTP mode. For more information, refer to [Rapid Spanning Tree Protocol \(RSTP\)](#).

To enter RSTP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `protocol spanning-tree rstp` command. The prompt changes to include (conf-rstp).

You can return to CONFIGURATION mode by using the `exit` command.

## ROUTE-MAP Mode

To configure a route map, use ROUTE-MAP mode.

To enter ROUTE-MAP mode:

1. Verify that you are logged in to CONFIGURATION mode.

2. Use the `route-map map-name [permit | deny] [sequence-number]` command. The prompt changes to include (config-route-map).

You can return to CONFIGURATION mode by using the `exit` command.

## ROUTER BGP Mode

To enable and configure Border Gateway Protocol (BGP), use ROUTER BGP mode. For more information, refer to [Border Gateway Protocol IPv4 \(BGPv4\)](#)

To enter ROUTER BGP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Use the `router bgp` command then enter the AS number. The prompt changes to include (conf-router\_bgp).

You can return to CONFIGURATION mode by using the `exit` command.

## ROUTER ISIS Mode

To enable and configure Intermediate System to Intermediate System (ISIS), use ROUTER ISIS mode. For more information, refer to [Intermediate System to Intermediate System \(IS-IS\)](#).

To enter ROUTER ISIS mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Use the `router isis` command. The prompt changes to include (conf-router\_isis).

You can return to CONFIGURATION mode by using the `exit` command.

## ROUTER OSPF Mode

To configure OSPF, use ROUTER OSPF mode. For more information, refer to [Open Shortest Path First \(OSPFv2\)](#).

To enter ROUTER OSPF mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `router ospf {process-id}` command. The prompt changes to include (conf-router\_ospf-id).

You can switch to INTERFACE mode by using the `interface` command or you can switch to ROUTER RIP mode by using the `router rip` command.

## ROUTER OSPFV3 Mode

To configure OSPF for IPv6, use ROUTER OSPFV3 mode.

To enter ROUTER OSPFV3 mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `ipv6 router ospf {process-id}` command. The prompt changes to include (conf-ipv6-router\_ospf).

You can return to CONFIGURATION mode by using the `exit` command.

## ROUTER RIP Mode

To enable and configure Router Information Protocol (RIP), use ROUTER RIP mode. For more information, refer to [Routing Information Protocol \(RIP\)](#).

To enter ROUTER RIP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `router rip` command. The prompt changes to include (conf-router\_rip).

You can return to CONFIGURATION mode by using the `exit` command.

## SPANNING TREE Mode

To enable and configure the Spanning Tree protocol, use SPANNING TREE mode. For more information, refer to [Spanning Tree Protocol \(STP\)](#).

To enter SPANNING TREE mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `protocol spanning-tree stp-id` command. The prompt changes to include (conf-stp).

You can return to CONFIGURATION mode by using the `exit` command.

## TRACE-LIST Mode

To configure a Trace list, use TRACE-LIST mode.

To enter TRACE-LIST mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `ip trace-list` command. Include the name of the Trace list. The prompt changes to include (conf-trace-acl).

You can exit this mode by using the `exit` command.

## VLT DOMAIN Mode

To enable and configure the VLT domain protocol, use VLT DOMAIN mode. For more information, refer to [Virtual Link Trunking \(VLT\)](#).

To enter VLT DOMAIN mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `vlt domain` command then the VLT domain number. The prompt changes to include (conf-vlt-domain).

You can return to CONFIGURATION mode by entering the `exit` command.

## VRRP Mode

To enable and configure Virtual Router Redundancy Protocol (VRRP), use VRRP mode. For more information, refer to [Virtual Router Redundancy Protocol \(VRRP\)](#).

To enter VRRP mode:

1. To enable VRRP globally, verify that you are logged in to CONFIGURATION mode.
2. Enter the `vrrp-group` command then enter the VRRP group ID. The prompt changes to include `(conf-if-interface-type-slot/port-vrid-vrrp-group-id)`.

## u-Boot Mode

To enable u-Boot mode, press any key when the following line appears on the console during a system boot: `Hit any key to stop autoboot:.` The prompt changes to include `(=>)`. For more information, refer to [S4810 u-Boot](#).

**NOTE:** You cannot use the Tab key to complete commands in u-Boot mode.

## UPLINK STATE GROUP Mode

To enable and configure an uplink-state group, use UPLINK STATE GROUP mode. For more information, refer to [Uplink Failure Detection \(UFD\)](#).

To enter UPLINK STATE GROUP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `uplink-state-group` command then the group ID number. The prompt changes to include `(conf-uplink-state-group-groupID)`.

# File Management

This chapter contains command line interface (CLI) commands needed to manage the configuration files as well as other file management commands.

## boot system

Tell the system where to access the Dell Networking OS image used to boot the system.

**Syntax** `boot system {gateway ip address| stack-unit [{stack-unit-number | all}] [default | primary {system {A: | B: | bmp-boot} | tftp: | | secondary}]}`

To return to the default boot sequence, use the `no boot system` command.

### Parameters

<b>gateway</b>	Enter the IP address of the default next-hop gateway for the management subnet.
<b>ip-address</b>	Enter an IP address in dotted decimal format.
<b>stack-unit</b>	Enter the stack-unit number for the master switch.
<b>stack-unit-number</b>	Enter the stack-unit number. The range is from 0 to 11.
<b>default</b>	Enter the keyword <code>default</code> to use the primary Dell Networking OS image.
<b>primary</b>	Enter the keyword <code>primary</code> to use the primary Dell Networking OS image.
<b>secondary</b>	Enter the keyword <code>secondary</code> to use the primary Dell Networking OS image.
<b>nfsmount</b>	Enter the keyword <code>nfsmount:</code> to retrieve the image from a mounted NFS file system. <code>nfsmount://filepath</code>
<b>system:</b>	Enter the keyword <code>system:</code> to retrieve the image from the system.
<b>tftp:</b>	Enter the keyword <code>TFTP:</code> to retrieve the image from a TFTP server. <code>tftp://hostip/filepath</code> .
<b>A:   B:</b>	Enter <code>A:</code> or <code>B:</code> to boot one of the system partitions.

### ***bmp-boot***

Enter the keyword `bmp-boot` to boot the system, when the you are not sure about the partition that contains image from DHCP offer.

**NOTE:** In normal-reload, this keyword is not enabled.

#### **Defaults**

Not configured.

#### **Command Modes**

CONFIGURATION

#### **Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

<b>Version</b>	<b>Description</b>
<b>9.7(0.0)</b>	Introduced the support for <code>bmp-boot</code> on the S-Series and Z-Series switches.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.

#### **Usage Information**

To display these changes in the `show bootvar` command output, save the running configuration to the startup configuration (using the `copy` command) and reload system.

The keyword `bmp-boot` is used only when the device boots up from BMP. In case of industrial standard upgraded device, the Dell networking OS stores the image partition upgraded from the DHCP offer in `bmp-boot` variable.

## **cd**

Change to a different working directory.

**Syntax** `cd directory`

#### **Parameters**

***directory***

(OPTIONAL) Enter one of the following:

- `flash:` (internal Flash) or any sub-directory
- `nfsmount://<mount-point>/filepath:` NFS mounted path

 **NOTE:** While switching to a remote NFS file system, it is mandatory to specify the mount-point that indicates the working directory on the NFS file system. You cannot enter the root directory of the remote NFS file system.

- `usbflash`: (internal Flash) or any sub-directory

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Added NFS mount support. Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

## HTTP Copy via CLI

Copy one file to another location. Dell Networking OS supports IPv4 and IPv6 addressing for FTP, TFTP, and SCP (in the *hostip* field).

This feature is supported on S4820T platform.

**Syntax** `copy http://10.16.206.77/sample_file flash://sample_filecopy  
flash://sample_file http://10.16.206.77/sample_file`

You can copy from the server to the switch and vice-versa.

### Parameters

**copy http:** Address or name of remote host []: 10.16.206.77  
**flash:** Port number of the server [80]:  
 Source file name []: sample\_file  
 User name to login remote host: x

Password to login remote host:

Destination file name [sample\_file]:

<b>Defaults</b>	None.				
<b>Command Modes</b>	EXEC Privilege				
<b>Command History</b>	<table><thead><tr><th>Version</th><th>Description</th></tr></thead><tbody><tr><td>9.3(0.1)</td><td>Introduced on the S6000, Z9000, S4810, and S4820T.</td></tr></tbody></table>	Version	Description	9.3(0.1)	Introduced on the S6000, Z9000, S4810, and S4820T.
Version	Description				
9.3(0.1)	Introduced on the S6000, Z9000, S4810, and S4820T.				
<b>Example</b>	<pre>copy http://admin:admin123@10.16.206.77/sample_file flash://sample_file</pre>				
<b>Related Commands</b>	<pre>copy ftp:flash</pre> <p>Copy files from FTP server to switch</p>				

## copy

Copy one file to another location. Dell Networking OS supports IPv4 and IPv6 addressing for FTP, TFTP, and SCP (in the *hostip* field).

**Syntax** `copy compressed-config source-file-url destination-file-url`

**Parameters** Enter the following location keywords and information:

**compressed-config** Enter the keyword `compressed-config` to copy one file, after optimizing and reducing the size of the configuration file, to another location. Dell Networking OS supports IPv4 and IPv6 addressing for FTP, TFTP, and SCP (in the *hostip* field).

**file-url**

**To copy a file from the internal FLASH**

enter `flash://` followed by the filename

**To copy a file on an FTP server**

enter `ftp://user:password@hostip/filepath`

**NOTE:** For FTP copy operations done through external servers, the password you specify for accessing the FTP server can be a string of up to 32 characters in length.

To copy a file on a HTTP server

enter `http: http://hostip/ filepath`

**NOTE:** For HTTP copy operations done through external servers, the password you specify for accessing the HTTP server can be a string of up to 32 characters in length.

To copy a file on a NFS mounted system

enter `nfsmount: //<mount-point/ filepath`

**NOTE:** While switching to a remote NFS file system, it is mandatory to specify the mount-point that indicates the working directory on the NFS file system. You cannot enter the root directory of the remote NFS file system.

To copy the running configuration

enter the keyword `running-config`

To copy the startup configuration

enter the keyword `startup-config`

To copy using a Secure Copy (SCP),

enter the keyword `scp:`

- If you enter `scp:` in the source position, enter the target URL;
- If you enter `scp:` in the target position, first enter the source URL;

**NOTE:** For SCP copy operations done through external servers, the password you specify can be a string of up to 32 characters in length.

To copy a file on the external FLASH

enter `slot0://` followed by the filename

To copy a file on a TFTP server

enter `tftp://hostip/filepath`

To copy a file from an external USB drive

enter `usbflash://filepath`

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON. Added the <code>nfsmount:&lt;mount-point&gt;</code> parameters that enables you to mount a remote NFS file system.
9.4(0.0)	Added the compressed-config parameter.
9.0.2.0	Introduced on the S6000.
8.4.1.0	Added IPv6 addressing support for FTP, TFTP, and SCP.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Added <code>usbflash</code> and <code>rpm0usbflash</code> commands on E-Series ExaScale.
7.6.1.0	Introduced on the S-Series and added the SSH port number to the SCP prompt sequence on all systems.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

**Usage Information**

Dell Networking OS supports a maximum of 100 files at the root directory level, on both the internal and external Flash.

When copying a file to a remote location (for example, using Secure Copy [SCP]), enter only the keywords and Dell Networking OS prompts you for the rest of the information. For example, when using SCP, you can enter `copy running-config scp:` where `running-config` is the source and the target is specified in the ensuing prompts. Dell Networking OS prompts you to enter any required information, as needed for the named destination—remote destination, destination filename, user ID, password, etc.

When you use the `copy running-config startup-config` command to copy the running configuration (the startup configuration file amended by any configuration changes made since the system was started) to the startup configuration file, Dell Networking OS creates a backup file on the internal flash of the startup configuration.

Dell Networking OS supports copying the running-configuration to a TFTP server, an FTP server, or a remote NFS file system. For example:

- `copy running-config tftp:`

- `copy running-config ftp:`
- `copy running-config nfsmount://<mount-point>/filepath`

You can compress the running configuration by grouping all the VLANs and the physical interfaces with the same property. Support to store the operating configuration to the startup config in the compressed mode and to perform an image downgrade without any configuration loss are provided.

Two existing exec mode CLIs are enhanced to display and store the running configuration in the compressed mode.

#### Example

```
Dell#copy running-config scp:/
Address or name of remote host []: 10.10.10.1
Destination file name [startup-config]? old_running
User name to login remote host? sburgess
Password to login remote host? dilling
```

In this `copy scp: flash: example`, specifying SCP in the first position indicates that the target is to be specified in the ensuing prompts. Entering `flash:` in the second position indicates that the target is the internal Flash. The source is on a secure server running SSH, so you are prompted for the user datagram protocol (UDP) port of the SSH server on the remote host.

#### Example

```
Dell#copy running-config nfsmount://<mount-point>/filepath
Destination file name [test.txt]:
User name to login remote host: username
Password to login remote host:
```

#### Example

```
Dell#copy scp: flash:
Address or name of remote host []: 10.11.199.134
Port number of the server [22]: 99
Source file name []: test.cfg
User name to login remote host: admin
Password to login remote host:
Destination file name [test.cfg]: test1.cfg
```

#### Example

```
Dell#copy compressed-config compressed-cfg
!
6655 bytes successfully copied
FTOS#
FTOS#copy compressed-config ftp:
Address or name of remote host []: 10.11.8.12
Destination file name [startup-config]:
User name to login remote host: spbalaji
Password to login remote host:
!
6655 bytes successfully copied
```

#### Related Commands

[cd](#) – changes the working directory.

# delete

Delete a file from the flash. After deletion, files cannot be restored.

**Syntax** `delete flash-url [no-confirm]`

**Parameters**

**flash-url**

Enter the following location and keywords:

- For a file or directory on the internal Flash, enter `flash://` followed by the filename or directory name.
- For a file or directory on the NFS mounted file system, enter `nfsmount://` followed by the mount point and the file path.

 **NOTE:** While deleting a file directory on a remote NFS file system, it is mandatory to specify the mount-point that indicates the working directory on the NFS file system. You cannot delete the root directory of the remote NFS file system.

- For a file or directory on an external USB drive, enter `usbflash://` followed by the filename or directory name.

**no-confirm**

(OPTIONAL) Enter the keyword `no-confirm` to specify that Dell Networking OS does not require user input for each file prior to deletion.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON. Added support for NFS mount.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

# dir

Display the files in a file system. The default is the current directory.

**Syntax** `dir [filename | directory name:]`

## Parameters

**filename |  
directory  
name:**

(OPTIONAL) Enter one of the following:

- For a file or directory on the internal Flash, enter `flash://` then the filename or directory name.
- For a file or directory on an NFS mounted file system, enter `nfsmount://` followed by the mount point and file path.

**NOTE:** While displaying a file directory on a remote NFS file system, it is mandatory to specify the mount-point that indicates the working directory on the NFS file system. You cannot display details corresponding to the root directory of the remote NFS file system.

- For a file or directory on the external Flash, enter `usbflash://` then the filename or directory name.

## Command Modes

EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.7(0.0)	Added support for NFS mount.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

## Example

```
Dell#dir
Directory of flash:

  1  drwx      8192   Jan 01 1980 00:00:00 +00:00  .
  2  drwx      3072  Dec 15 2014 06:27:10 +00:00  ..
  3  drwx      4096   Jan 01 1980 00:02:44 +00:00
TRACE_LOG_DIR
```

```

 4 drwx          4096   Jan 01 1980 00:02:44 +00:00

 7 drwx          4096   Nov 06 2014 06:57:06 +00:00
CONFIG_TEMPLATE
 8 -rwx          4625   Nov 06 2014 06:55:28 +00:00 startup-
config
 9 drwx          4096   May 31 2013 02:49:46 +00:00
CONFD_LOG_DIR
flash: 2056916992 bytes total (2052784128 bytes free)

```

**Example (NFS Mount)**

```

Dell#dir nfsmount:
Directory of nfsmount:

 1 drwx          512   Nov 06 2014 06:58:19 +00:00 .
 2 drwx          512   Nov 06 2014 06:58:19 +00:00 ..

nfsmount: 1463410688 bytes total (618045440 bytes free)

```

**Related Commands**

[cd](#) – changes the working directory.

## format (S-Series)

Erase all existing files and reformat the filesystem in the internal flash memory. After the filesystem is formatted, files cannot be restored.

**Syntax** `format flash:`

**Defaults** `flash memory`

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series

**Usage Information**

You must include the colon (:) when entering this command.  
After reformatting is complete, three empty directories are automatically created on flash: CRASH\_LOG\_DIR, TRACE\_LOG\_DIR and NVTRACE\_LOG\_DIR.

**CAUTION: This command deletes all files, including the startup configuration file. So, after executing this command, consider saving the running config as the startup config (use the `write memory` command or `copy run start` command).**

**Related Commands**

[copy](#) – copies the current configuration to either the startup-configuration file or the terminal.

[show file-systems](#) – displays information about the file systems on the system.

## fsck flash

Checks the flash file system for errors.

**Syntax**

```
fsck flash:  
  
fsck usbflash:
```

**Defaults**

none

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.1(0.0)	Introduced on S4810 and Z9000.
8.3.19.0	Introduced on S4820T.

**Usage Information**

Include the colon (:) when entering this command. This command checks the specified flash memory for errors. If errors are found, the command recommends that you format the flash.

**CAUTION:** If you elect to format the flash, all files – including the startup configuration file – are lost. If you do decide to format the specified flash, consider saving the running configuration as the startup configuration after formatting the flash (use the `write memory` command or `copy run start` command).

**Related  
Commands**

- [copy](#) – copy one file to another location.
- [show file-systems](#) – Display information about the file systems on the system.

## mkdir

Creates a directory on the NFS mounted file system.

**Syntax** `mkdir nfsmount://mount-point/username`

**Command  
Modes** CONFIGURATION

**Command  
History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S-Series.

**Example** `Dell#mkdir nfsmount:/nfs-mountpoint/guest`

**Related  
Commands** [rmdir](#) – removes a directory.

## mount nfs

Mounts an NFS file system to a device.

**Syntax** `mount nfs rhost:path mount-point [username password]`

**Parameters** Enter the following location keywords and information:

<b><i>rhost:path</i></b>	Enter the remote hosts's path directory.
<b><i>mount-point</i></b>	Enter the folder name in the local file system.

**username** (OPTIONAL) Enter the user name to access the device.  
**password** (OPTIONAL) Enter the password.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S-Series.

**Example**

```
Dell#mount nfs nfstest nfs-mount-point username pwd
```

**Related Commands**

[cd](#) – changes the working directory.

## rmdir

Removes a directory from the NFS mounted file system.

**Syntax**

```
rmdir nfsmount://mount-point/username
```

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S-Series.

**Example**

```
Dell#rmdir nfsmount:/nfs-mountpoint/guest  
Proceed to remove the directory [confirm yes/no]: yes  
Dell#
```

**Related Commands**

[mkdir](#) – creates a directory.

# upgrade system

Upgrade the Dell Networking OS image. To upgrade the bootflash or bootselector image, use the `upgrade boot` command.

<b>Syntax</b>	<code>upgrade system {flash:   ftp:   nfsmount:   scp:   stack-unit {stack-unit-id   all}   tftp:   usbflash:} file-url {A:  B:}</code>	
<b>Parameters</b>		
	<b>system</b>	Enter the keyword <code>system</code> to upgrade the operating system (OS) image.
	<b>flash: file-url</b>	Enter the keyword <code>flash:</code> and specify the location of the image file in the format <code>//directory-path</code> or press Enter to launch a prompt sequence.
	<b>ftp: file-url</b>	Enter the keyword <code>ftp:</code> and specify the location of the image file in the format <code>//userid:password@host-ip/filepath</code> or press Enter to launch a prompt sequence.
	<b>nfsmount://&lt;mount-point&gt;/filepath</b>	Enter the keyword <code>nfsmount:</code> and specify the location of the image file in the format <code>//&lt;mount-point&gt;/filepath</code> .
	<b>scp: file-url</b>	Enter the keyword <code>scp:</code> and specify the location of the image file in the format <code>userid:password@host-ip/filepath</code> or press Enter to launch a prompt sequence.
	<b>stack-unit stack-unit-id</b>	Enter the keyword <code>stack-unit</code> and specify the stack-unit ID to sync the image to that stack-unit.
	<b>stack-unit all</b>	Enter the keyword <code>stack-unit</code> followed by the keyword <code>all</code> to sync the image on all stack-units.
	<b>tftp: file-url</b>	Enter the keyword <code>tftp:</code> and specify the location of the image file in the format <code>//host-ip/filepath</code> or press Enter to launch a prompt sequence.
	<b>usbflash: file-url</b>	Enter the keyword <code>usbflash:</code> and specify the location of the source file in the format <code>//directory-path</code> to upgrade from an external flash device or press Enter to launch a prompt sequence.
	<b>A:   B:</b>	Specify the flash partition of the operating-system image to be upgraded.
<b>Defaults</b>	none	
<b>Command Modes</b>	EXEC Privilege	

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Added support for NFS mount.
9.2(1.0)	Introduced on the Z9500.
9.0(0.0)	Added support for IPv6 for the <code>file-url</code> parameter.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000. Added support for the SSD on the Z9000 only.
8.3.7.0	Introduced on the S4810.
7.7.1.0	Added support for TFTP and SCP.
7.6.1.0	Introduced on the S-Series.

**Usage Information**

RFC 3986 specifies that IPv6 host addresses in a uniform resource identifier (URI) must be enclosed in square brackets, [X:X:X:X::X]. For maximum flexibility this command accepts IPv6 host addresses with or without the square brackets.

After you upgrade the system image, by entering the command, specify the location where the Dell Networking OS image used to boot the system is stored (`boot system`), save the configuration to the start-up config file (`write memory`), and reload the system (`reload`).

**Example**

```

Dell# upgrade system tftp://10.11.8.12/dv-rainier-13 a:
00:39:32 : Discarded 1 pkts. Expected block num : 51. Received
block num: 50
!00:39:36 : Discarded 1 pkts. Expected block num : 65.
Received block num: 64

!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
.....!
93924044 bytes successfully copied
System image upgrade completed successfully.
!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
!!!!!!!!!!!!!!
Image upgraded to all

```

# rename

Rename a file in the local file system.

**Syntax** `rename url url`

**Parameters** `url` Enter the following keywords and a filename:

- For a file on the internal Flash, enter `flash://` followed by the filename.
- For a file on an NFS mounted file system, enter `nfsmount://` followed by the mount point and file path.
- For a file on an external USB drive, enter `usbflash://` followed by the filename.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON. Added support for NFS mount.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on S-Series
7.5.1.0	Introduced on C-Series
E-Series	Original command

# restore factory-defaults

Restore factory defaults.

**Syntax** `restore factory-defaults stack-unit {stack-unit-number | all} {clear-all | bootvar | nvram}`

## Parameters

<b>factory-defaults</b>	Return the system to its factory default mode.
<b>stack-unit-number</b>	Enter the stack member unit identifier to restore only the mentioned stack-unit. For the S4810, the range is from 0 to 11.
<b>all</b>	Enter the keyword <code>all</code> to restore all units in the stack.
<b>bootvar</b>	Enter the keyword <code>bootvar</code> to reset boot line.
<b>clear-all</b>	Enter the keywords <code>clear-all</code> to reset the NvRAM, boot environment variables, and the system startup configuration.
<b>nvrाम</b>	Enter the keyword <code>nvrाम</code> to reset the NvRAM only.

## Command Modes

EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
<b>9.5(0.1)</b>	Added <code>bootvar</code> as a new parameter.
<b>9.2(1.0)</b>	Introduced on the Z9500.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>9.0.0.0</b>	Introduced on the Z9000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.12.0</b>	Introduced on the S4810.
<b>8.3.16.0</b>	Introduced on the MXL 10/40GbE Switch IO Module.

## Usage Information

Restoring factory defaults deletes the existing startup configuration and all persistent settings (stacking, fan-out, and so forth).

When restoring all units in a stack, all the units in the stack are placed into stand-alone mode.

When restoring a single unit in a stack, that unit placed in stand-alone mode. No other units in the stack are affected.

When restoring units in stand-alone mode, the units remain in stand-alone mode after the restoration. After the restore is complete, the units power cycle immediately.

**CAUTION: There is no undo for this command.**

Following are the factory-default environment variables:

- baudrate
- primary\_boot
- secondary\_boot
- default\_boot
- ipaddr
- gatewayip
- netmask
- macaddr
- mgmtautoneg
- mgmtspeed100
- mgmtfullduplex

Each boot path variable (primary\_boot, secondary\_boot, and default\_boot) is further split into the following three independent variables:

- primary\_server, primary\_file, and primary\_type
- secondary\_server, secondary\_file, and secondary\_type
- default\_server, default\_file, and default\_type

**NOTE:** For information on the default values that these variables take, refer to the *Restoring Factory Default Environment Variables* section in the *Dell Networking OS Configuration guide*.

**Example (all stack units)**

```
Dell#restore factory-defaults stack-unit all clear-all
*****
* Warning - Restoring factory defaults will delete the
existing *
* startup-config and all persistent settings (stacking,
fanout, etc.)*
* All the units in the stack will be split into standalone
units. *
* After restoration the unit(s) will be powercycled
immediately. *
* Proceed with caution ! *
*****
Proceed with factory settings? Confirm [yes/no]:yes
-- Restore status --

```

# show boot system

Displays information about boot images currently configured on the system.

**Syntax** `show boot system {stack-unit | all}`

**Parameters**

- all** Enter the keyword `all` to display the boot image information for all stack units.
- stack-unit** Enter the keyword `stack-unit` followed by a number to display boot image information for a stack-unit. The S4810 range is from 0 to 11.

**Defaults** none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000
8.3.7.0	Introduced on the S4810.
7.7.1.0	Introduced on the C-Series and E-Series.

## Example

```
Dell#show boot system stack-unit 1

Current system image information in the system:
=====

Type           Boot Type           A           B
-----
Stack-unit 1   FLASH BOOT         9-0 (2-1)   9-0 (2-0)
[boot]
Dell#
```

# show bootvar

Display the variable settings for the boot parameters.

**Syntax**                    show bootvar

**Command Modes**            EXEC Privilege

**Command History**           This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.4	Output expanded to display current reload mode (normal or Jumpstart).
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

## Example

```
Dell#show bootvar
PRIMARY IMAGE FILE = system://B
SECONDARY IMAGE FILE = tftp://10.16.127.35/Dell-SI-9-0-2-0.bin
DEFAULT IMAGE FILE = system://A
LOCAL CONFIG FILE = variable does not exist
PRIMARY HOST CONFIG FILE = variable does not exist
SECONDARY HOST CONFIG FILE = variable does not exist
PRIMARY NETWORK CONFIG FILE = variable does not exist
SECONDARY NETWORK CONFIG FILE = variable does not exist
CURRENT IMAGE FILE = system://B
CURRENT CONFIG FILE 1 = flash://startup-config
CURRENT CONFIG FILE 2 = variable does not exist
CONFIG LOAD PREFERENCE = local first
BOOT INTERFACE GATEWAY IP ADDRESS = 10.16.132.254
Reload Mode = normal-reload
Dell#
```

# show file-systems

Display information about the file systems on the system.

**Syntax** `show file-systems`

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series
7.5.1.0	Introduced on the C-Series
E-Series	Original command

## Example

```
Dell#show file-systems
Size(b) Free(b) Feature Type Flags Prefixes
63938560 51646464 dosFs2.0 MMC rw flash:
63938560 18092032 dosFs1.0 MMC rw slot0:
- - - network rw ftp:
- - - network rw tftp:
- - - network rw scp:
Dell#
```

## Command Fields

Field	Description
<b>size(b)</b>	Lists the size (in bytes) of the storage location. If the location is remote, no size is listed.
<b>Free(b)</b>	Lists the available size (in bytes) of the storage location. If the location is remote, no size is listed.
<b>Feature</b>	Displays the formatted DOS version of the device.
<b>Type</b>	Displays the type of storage. If the location is remote, the word <code>network</code> is listed.
<b>Flags</b>	Displays the access available to the storage location. The following letters indicate the level of access:

Field	Description
	<ul style="list-style-type: none"> <li>• r = read access</li> <li>• w = write access</li> </ul>
Prefixes	Displays the name of the storage location.

**Related Commands** [format flash \(S-Series\)](#) – Erases all the existing files and reformats the filesystem in the internal flash memory on the S-Series.

## show running-config

Display the current configuration and display changes from the default values.

**Syntax** `show running-config [entity] [configured] [status] [compressed]`

**Parameters**

**entity** (OPTIONAL) To display that entity's current (non-default) configuration, enter one of the following keywords:

**NOTE:** If you did not configure anything that entity, nothing displays and the prompt returns.

<b>aaa</b>	for the current AAA configuration
<b>acl</b>	for the current ACL configuration
<b>arp</b>	for the current static ARP configuration
<b>as-path</b>	for the current AS-path configuration
<b>bfd</b>	for the current BFD configuration
<b>bgp</b>	for the current BGP configuration
<b>boot</b>	for the current boot configuration
<b>cam-profile</b>	for the current CAM profile in the configuration
<b>class-map</b>	for the current class-map configuration
<b>community-list</b>	for the current community-list configuration
<b>ecmp-group</b>	for the current ECMP group configuration
<b>eis</b>	for the current EIS configuration
<b>ethernet</b>	for the current Ethernet CFM configuration

<b>fefd</b>	for the current FEFD configuration
<b>ftp</b>	for the current FTP configuration
<b>frrp</b>	for the current FRRP configuration
<b>fvrp</b>	for the current FVRP configuration
<b>gvrp</b>	for the current GVRP configuration
<b>host</b>	for the current host configuration
<b>hardware-monitor</b>	for hardware-monitor action-on-error settings
<b>hypervisor</b>	for the current hypervisor configuration
<b>igmp</b>	for the current IGMP configuration
<b>interface</b>	for the current interface configuration
<b>interface port-channel</b>	for the current port-channel interface configuration. The range is from 1 to 128.
<b>interface tunnel</b>	for all configured tunnels. For a specific tunnel, enter the tunnel ID. The range is from 1 to 16383.
<b>ip</b>	for the current IP configuration
<b>isis</b>	for the current ISIS configuration
<b>line</b>	for the current line configuration
<b>lldp</b>	for the current LLDP configuration
<b>load-balance</b>	for the current port-channel load-balance configuration
<b>logging</b>	for the current logging configuration
<b>mac</b>	for the current MAC ACL configuration
<b>mac-address-table</b>	for the current MAC configuration
<b>management-eis</b>	for the current management EIS configuration
<b>management-route</b>	for the current Management port forwarding configuration
<b>mld</b>	for the current MLD configuration
<b>monitor</b>	for the current Monitor configuration
<b>mroute</b>	for the current Mroutes configuration
<b>msdp</b>	for the current MSDP configuration
<b>ntp</b>	for the current NTP configuration

<b>ospf</b>	for the current OSPF configuration
<b>pim</b>	for the current PIM configuration
<b>policy-map-input</b>	for the current input policy map configuration
<b>policy-map-output</b>	for the current output policy map configuration
<b>po-failover-group</b>	for the current port-channel failover-group configuration
<b>prefix-list</b>	for the current prefix-list configuration
<b>privilege</b>	for the current privilege configuration
<b>qos-policy-input</b>	for the current input QoS policy configuration
<b>qos-policy-output</b>	for the current output QoS policy configuration
<b>radius</b>	for the current RADIUS configuration
<b>redirect-list</b>	for the current redirect-list configuration
<b>redundancy</b>	for the current RPM redundancy configuration
<b>resolve</b>	for the current DNS configuration
<b>rip</b>	for the current RIP configuration
<b>rmon</b>	for the current RMON configuration
<b>route-map</b>	for the current route map configuration
<b>sflow</b>	for the current sFlow configuration
<b>snmp</b>	for the current SNMP configuration
<b>spanning-tree</b>	for the current spanning tree configuration
<b>static</b>	for the current static route configuration
<b>status</b>	for the file status information
<b>tacacs+</b>	for the current TACACS+ configuration
<b>tftp</b>	for the current TFTP configuration
<b>trace-group</b>	for the current trace-group configuration
<b>trace-list</b>	for the current trace-list configuration

<b>uplink-state-group</b>	for the uplink state group configuration
<b>users</b>	for the current users configuration
<b>vlt</b>	for the current VLT configuration
<b>wred-profile</b>	for the current wred-profile configuration

- configured** (OPTIONAL) Enter the keyword `configuration` to display line card interfaces with non-default configurations only.
- status** (OPTIONAL) Enter the keyword `status` to display the checksum for the running configuration and the start-up configuration.
- compressed** (Optional) Enter the keyword `compressed` to display the compressed group configuration. Displays the compressed configuration by grouping all similar configurations. The compression is done only for interface related configurations.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.2.(0.0)	Added support for the tunnel and EIS interface types.
9.0.0.0	Added support for the VLT option.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Added the hardware-monitor option.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Expanded to include the last configuration change, start-up last updated (date and time), and who made the change.
6.5.4.0	Added the status option.

## Example

```
Dell# show running-config
Current Configuration ...
! Version 9-0(2-0)
! Last configuration change at Thu Apr 18 10:18:39 2013 by
admin
! Startup-config last updated at Thu Apr 18 10:18:40 2013 by
admin
!

### Related Commands

[show running-config](#) – displays the current (running) configuration.

## show os-version

Display the release and software image version information of the image file specified.

**Syntax** `show os-version [file-url]`

### Parameters

***file-url***

(OPTIONAL) Enter the following location keywords and information:

- For a file on the internal flash, enter `flash://` followed by the filename.
- For a file on an FTP server, enter `ftp://user:password@hostip/filepath`.
- For a file on a TFTP server, enter `tftp://hostip/filepath`.
- For a file on the USB port, enter `usbflash://filepath`.

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

Build Path: /work.local/build/buildSpaces/build01/E9-4-0/SW/
```

```

SRCC
Dell Networking OS uptime is 1 day(s), 0 hour(s), 19 minute(s)
System image file is "DT-MAA-S6000-16-PI"
System Type: S6000
Control Processor: Intel Centerton with 3203911680 bytes of
memory, core(s) 2.
16G bytes of boot flash memory.
1 32-port TE/FG (SI)
32 Forty GigabitEthernet/IEEE 802.3 interface(s)

```

## upgrade

Upgrade the bootflash image or system image of the management unit.

**Syntax**

```

upgrade {boot | system} {ftp: | scp: | tftp: | flash: {A: |B:}
| stack-unit | usbflash | slot0:} file-url

```

### Parameters

<b>boot</b>	Enter the keyword <code>boot</code> to change the boot image.
<b>system</b>	Enter the keyword <code>system</code> to change the system image.
<b>ftp:</b>	After entering the keyword <code>ftp:</code> , you can either follow it with the location of the source file in this form: <code>//userid:password@hostip/filepath</code> or press Enter to launch a prompt sequence.
<b>scp:</b>	After entering the keyword <code>scp:</code> , you can either follow it with the location of the source file in this form: <code>//userid:password@hostip/filepath</code> or press Enter to launch a prompt sequence.
<b>slot0:</b>	After entering the keyword <code>slot0:</code> , you can either follow it with the location of the source file in this form: <code>//hostlocation/filepath</code> or press Enter to launch a prompt sequence.
<b>tftp:</b>	After entering the keyword <code>tftp:</code> , you can either follow it with the location of the source file in this form: <code>//hostlocation/filepath</code> or press Enter to launch a prompt sequence.
<b>flash:</b>	After entering the keyword <code>flash:</code> , you can either follow it with the location of the source file in this form: <code>flash//filepath</code> or press Enter to launch a prompt sequence.
<b>A:   B:</b>	Enter the partition to upgrade from the flash.
<b>stack-unit:</b>	Enter the keywords <code>stack-unit:</code> to synch the image to the stack-unit.

**file-url**

Enter the following location keywords and information to upgrade using an Dell Networking OS image other than the one currently running:

- To specify an Dell Networking OS image on the internal flash, enter `flash:// file-path/filename`.
- To specify an Dell Networking OS image on an FTP server, enter `ftp://user:password@hostip/filepath`.
- To specify an Dell Networking OS image on the external flash, enter `slot0://file-path/filename`.
- To copy a file on a TFTP server, enter `tftp://hostip/filepath/filename`.

where `hostip` is either an IPv4 dotted decimal address or an IPv6 URI `[x:x:x:x::x]` format address.

**Defaults**

none

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.0(0.0)	Added support for IPv6 for the <code>file-url</code> parameter.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000. Added support for the SSD on the Z9000 only.
8.3.7.0	Introduced on the S4810.
7.7.1.0	Added support for TFTP and SCP.
7.6.1.0	Introduced on the S-Series.

**Usage Information**

RFC 3986 specifies that IPv6 host addresses in a uniform resource identifier (URI) must be enclosed in square brackets, `[X:X:X:X::X]`. For maximum flexibility this command accepts IPv6 host addresses with or without the square brackets.

Reload Dell Networking OS after executing this command. To copy Dell Networking OS from the management unit to one or more stack members, use the `upgrade system stack-unit (S-Series stack member)` command.

**Example**

```
Dell# upgrade system ?
ftp:      Copy from remote file system (ftp://
userid:password@hostip/filepath)
scp:      Copy from remote file system (scp://
userid:password@hostip/filepath)
```

<b>Defaults</b>	flash drive				
<b>Command Modes</b>	EXEC mode				
<b>Command History</b>	Version 9.5.(0.0)				
	<table> <thead> <tr> <th>Version</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>9.5(0.0)</td> <td>Introduced on the Z9000, S6000, S4820T, S4810, and MXL.</td> </tr> </tbody> </table>	Version	Description	9.5(0.0)	Introduced on the Z9000, S6000, S4820T, S4810, and MXL.
Version	Description				
9.5(0.0)	Introduced on the Z9000, S6000, S4820T, S4810, and MXL.				

**Usage Information** You can enter this command in the following ways:

- **verify md5 flash://img-file**
- **verify md5 flash://img-file <hash-value>**
- **verify sha256 flash://img-file**
- **verify sha256 flash://img-file <hash-value>**

**Example Without Entering the Hash Value for Verification using SHA256**

```
Dell# verify sha256 flash://FTOS-SE-9.5.0.0.bin
SHA256 hash for FTOS-SE-9.5.0.0.bin:
e6328c06faf814e6899ceead219afbf9360e986d692988023b749e6b2093e93
3
```

**Entering the Hash Value for Verification using SHA256**

```
Dell# verify sha256 flash://FTOS-SE-9.5.0.0.bin
e6328c06faf814e6899ceead219afbf9360e986d692988023b749e6b2093e93
3
SHA256 hash VERIFIED for FTOS-SE-9.5.0.0.bin
```

# Control and Monitoring

This chapter contains the commands to configure and monitor the system, including Telnet, file transfer protocol (FTP), and trivial file transfer protocol (TFTP).

 **NOTE:** This command replaces the `enable optic-info-update interval` command to update information on temperature and power monitoring in the simple network management protocol (SNMP) management information base (MIB).

## asf-mode

Enable alternate store and forward (ASF) mode and forward packets as soon as a threshold is reached.

**Syntax** `asf-mode stack-unit {unit-id | all} queue size`  
 To return to standard Store and Forward mode, use the `no asf-mode stack-unit` command.

**Parameters**

<b>unit-id</b>	Enter the stack member unit identifier of the stack member to reset. The S4820T range is from 0 to 11.
	 <b>NOTE:</b> The S4820T commands accept Unit ID numbers from 0 to 11, though S4820T supports stacking of up to six units.
<b>queue size</b>	Enter the queue size of the stack member. The range is from 0 to 15.

**Defaults** Not configured

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.0	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.

**Usage Information**

You *must* save the configuration and reload the system to implement ASF. When you enter the command, the system sends a message stating that the new mode is enabled when the system reloads.

## banner exec

Configure a message that is displayed when your enter EXEC mode.

**Syntax**

`banner exec c line c`

To delete a banner, use the `no banner exec` command.

**Parameters**

- c** Enter the keywords `banner exec`, then enter a character delineator, represented here by the letter `c`. Press **ENTER**.
- line** Enter a text string for your banner message ending the message with your delineator. In the following example, the delineator is a percent character (%); the banner message is "testing, testing".

**Defaults**

No banner is displayed.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series ExaScale.

Version	Description
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original Command

#### Usage Information

After entering the banner login command, type one or more spaces and a delineator character. Enter the banner text then the second delineator character. When the user is connected to the router, if a message of the day banner is configured, it displays first. If no message of the day banner is configured, the login banner and prompt appear. After the user has logged in, the banner EXEC (if configured) displays.

#### Example

```
Dell(conf)#banner exec ?
LINE c banner-text c, where 'c' is a delimiting character
Dell(conf)#banner exec %
Enter TEXT message. End with the character '%'.
This is the banner%
Dell(conf)#end
Dell#exit
4d21h5m: %RPM0-P:CP %SEC-5-LOGOUT: Exec session is terminated
for user on line

console
This is the banner
Dell>
```

#### Related Commands

[line](#) — enables and configures the console and virtual terminal lines to the system.

## banner login

Set a banner to display when logging on to the system.

#### Syntax

```
banner login {keyboard-interactive | no keyboard-interactive}
[c line c]
```

Enter **no banner login** to delete the banner text. Enter **no banner login keyboard-interactive** to automatically go to the banner message prompt (does not require a carriage return).

<b>Parameters</b>	<p><b>keyboard-interactive</b> Enter the keyword <code>keyboard-interactive</code> to require a carriage return (CR) to get the message banner prompt.</p> <p><b>c</b> Enter a delineator character to specify the limits of the text banner. The delineator is a percent character (%).</p> <p><b>line</b> Enter a text string for your text banner message ending the message with your delineator. The delineator is a percent character (%). Range: maximum of 50 lines, up to 255 characters per line</p>																						
<b>Defaults</b>	No banner is configured and the CR is required when creating a banner.

```

**Related  
Commands**

[banner motd](#) — sets a Message of the Day banner.

[banner exec](#) — enables the display of a text string when you enter EXEC mode.

## banner motd

Set a message of the day (MOTD) banner.

**Syntax**

```
banner motd c line c
```

To delete a Message of the Day banner, enter **no banner motd**.

**Parameters**

<b>c</b>	Enter a delineator character to specify the limits of the text banner. The delineator is a percent character (%).
<b>line</b>	Enter a text string for your MOTD banner the message with your delineator. The delineator is a percent character (%).

**Defaults**

No banner is configured.

**Command  
Modes**

CONFIGURATION

**Command  
History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command

### Usage Information

After entering the banner login command, type one or more spaces and a delineator character. Enter the banner text then the second delineator character. When the user is connected to the router, if a message of the day banner is configured, it displays first. If no message of the day banner is configured, the login banner and prompt appear. After the user has logged in, the banner EXEC (if configured) displays.

### Related Commands

[banner exec](#) — enables the display of a text string when you enter EXEC mode.

[banner login](#) — sets a banner to display after successful login to the system.

## cam-acl

Allocate content addressable memory (CAM) for IPv4 and IPv6 ACLs.

### S4820T

#### Syntax

```
cam-acl {default | l2acl number ipv4acl number ipv6acl number
ipv4qos number l2qos number l2pt number ipmacacl number [vman-
qos | vman-dual-qos] number ecfmacacl number {fcoeacl number}
{iscsiptacl {0|2}} {openflow {4|8}}
```

#### Parameters

##### default

Use the default CAM profile settings and set the CAM as follows:

- L3 ACL (ipv4acl): 4
- L2 ACL(l2acl): 6
- IPv6 L3 ACL (ipv6acl): 0
- L3 QoS (ipv4qos): 2
- L2 QoS (l2qos): 1
- OpenFlow: 0 (disabled)
- FCoE (fcoeacl): 0 (disabled)

- iSCSI Optimization (iscsiopactl): 0 (disabled)

Allocate space to each CAM region.

Enter the CAM profile name then the amount of CAM space to be allotted. The total space allocated must equal 13. The ipv6acl range must be a factor of 2.

Enter 4 or 8 for the number of OpenFlow FP blocks.

- 4: Creates 242 entries for use by the OpenFlow controller (256 total entries minus the 14 entries reserved for internal functionality)
- 8: Creates 498 entries for use by the OpenFlow controller (512 total entries minus the 14 entries reserved for internal functionality)

Using the `fcoe` parameter, enter the number of FP groups to be allocated for FCoE transit. Enter 1 – 6; maximum six groups. Each group has 128 entries, creating a total of 768 possible entries for FCoE FP groups. The value given must be an even number.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.2(0.2)	Added support for the <code>fcoe</code> parameter on the S4810 and S4820T.
9.1.(0.0)	Added support for OpenFlow on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Added the keywords <code>fcoeacl</code> and <code>iscsiopactl</code> on the S4810.
8.3.11.1	Introduced on the Z9000.
8.3.1.0	Added the keywords <code>ecfmacl</code> , <code>vman-qos</code> , and <code>vman-dual-qos</code> .
8.2.1.0	Introduced on the S-Series.
7.8.1.0	Introduced on the C-Series.

## Usage Information

For the new settings to take effect, save the new CAM settings to the startup-config (`write-mem` or `copy run start`) then reload the system.

The total amount of space allowed is 16 FP Blocks. System flow requires three blocks and these blocks cannot be reallocated. The `ipv4acl` profile range is from 1 to 4.

When configuring space for IPv6 ACLs, the total number of Blocks must equal 13.

Ranges for the CAM profiles are from 1 to 10, except for the `ipv6acl` profile which is from 0 to 10. The `ipv6acl` allocation must be a factor of 2 (2, 4, 6, 8, 10).

If you enabled BMP, to perform a reload on the chassis to upgrade any configuration changes that have changed the NVRAM content, use the `reload conditional nvramp-cfg-change` command.

## cam-acl-vlan

Specify the number of VFP blocks allocated to OpenFlow.

### Syntax

```
cam-acl-vlan vlanopenflow {0|1}
```

### Defaults

Disabled.

### Parameters

**vlanopenflow** Enter the number 1 to allocate VFP blocks and enable OpenFlow.  
(Default) Enter the number 0 to disable OpenFlow.

### Command Modes

CONFIGURATION

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.1.(0.0)	Introduced on S4810.
8.3.19.0	Introduced on the S4820T.

## Usage Information

Reboot the switch after changing the parameter values for changes to take effect.

For platform-specific instructions about using this command, refer to the *SDN* chapter in the *Dell Networking OS Configuration Guide*.

## clear line

Reset a terminal line.

**Syntax** `clear line {line-number | console 0 | vty number}`

**Parameters**

<b><i>line-number</i></b>	Enter a number for one of the 12 terminal lines on the system. The range is from 0 to 11.
<b>aux 0</b>	Enter the keywords <code>aux 0</code> to reset the auxiliary port.
<b>console 0</b>	Enter the keywords <code>console 0</code> to reset the console port.
<b><i>vtty number</i></b>	Enter the keyword <code>vtty</code> then a number to clear a terminal line. The range is from 0 to 9.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

## configure

Enter CONFIGURATION mode from EXEC Privilege mode.

**Syntax** `configure [terminal]`

**Parameters**

<b>terminal</b>	(OPTIONAL) Enter the keyword <code>terminal</code> to specify that you are configuring from the terminal.
-----------------	---

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

**Example**

```
Dell#configure
Dell(conf)#
```

## disable

Return to EXEC mode.

**Syntax** `disable [level]`

**Parameters**

<b>level</b>	(OPTIONAL) Enter a number for a privilege level of the Dell Networking OS. The range is from 0 to 15. The default is <b>1</b> .
--------------	---

<b>Defaults</b>	<b>1</b>
<b>Command Modes</b>	EXEC Privilege
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .

The following is a list of the Dell Networking OS version history for this command.

<b>Version</b>	<b>Description</b>
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.1.1.0</b>	Introduced on the E-Series ExaScale.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>E-Series</b>	Original command.

## do

Allows the execution of most EXEC-level commands from all CONFIGURATION levels without returning to the EXEC level.

<b>Syntax</b>	<code>do <i>command</i></code>
<b>Parameters</b>	<b><i>command</i></b> Enter an EXEC-level command.
<b>Defaults</b>	none
<b>Command Modes</b>	<ul style="list-style-type: none"> <li>CONFIGURATION</li> <li>INTERFACE</li> </ul>
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.1.1.0	Introduced on the E-Series.

### Usage Information

The following commands are *not* supported by the `do` command:

- `enable`
- `disable`
- `exit`
- `config`

### Example

```
Dell(conf-if-te-5/1)#do clear counters
Clear counters on all interfaces [confirm]
Dell(conf-if-te-5/1)#
Dell(conf-if-te-5/1)#do clear logging
Clear logging buffer [confirm]
Dell(conf-if-te-5/1)#
Dell(conf-if-te-5/1)#do reload
System configuration has been modified. Save? [yes/no]: n
Proceed with reload [confirm yes/no]: n
```

## enable

Enter EXEC Privilege mode or any other privilege level configured. After entering this command, you may need to enter a password.

**Syntax** `enable [level]`

**Parameters**

*level* (OPTIONAL) Enter a number for a privilege level of Dell Networking OS. The range is from 0 to 15.

**Defaults** **15**

**Command Modes** EXEC

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.0)	Added support for roles on the Z9000, S6000, S4820T, S4810, and MXL.
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

## Usage Information

Users entering EXEC Privilege mode or any other configured privilege level can access configuration commands. To protect against unauthorized access, use the `enable password` command to configure a password for the `enable` command at a specific privilege level. If no privilege level is specified, the default is privilege level **15**.

**NOTE:** If you are authorized for the EXEC Privilege mode by your role, you do not need to enter an enable password.

## Related Commands

[enable password](#) — configures a password for the `enable` command and to access a privilege level.

# enable optic-info-update interval

Enable polling intervals of optical information updates for simple network management protocol (SNMP).

## Syntax

```
enable optical-info-update interval seconds
```

To disable optical power information updates, use the `no enable optical-info-update interval` command.

<b>Parameters</b>	<b>interval</b> <b>seconds</b>	Enter the keyword <code>interval</code> then the polling interval in seconds. The range is from 120 to 6000 seconds. The default is <b>300 seconds</b> (5 minutes).										
<b>Defaults</b>	Disabled											
<b>Command Modes</b>	CONFIGURATION											
<b>Command History</b>		<p>This guide is platform-specific. - ROUTER RIP
- ROUTER ISIS
- ROUTER BGP

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series and E-Series.
E-Series	Original command.

### Related Commands

[exit](#) — returns to the lower command mode.

## exec-timeout

Set a time interval that the system waits for input on a line before disconnecting the session.

### Syntax

```
exec-timeout minutes [seconds]
```

To return to default settings, use the `no exec-timeout` command.

### Parameters

<i>minutes</i>	Enter the number of minutes of inactivity on the system before disconnecting the current session. The range is from 0 to 35791. The default is <b>10 minutes</b> for the console line and <b>30 minutes</b> for the VTY line.
<i>seconds</i>	(OPTIONAL) Enter the number of seconds. The range is from 0 to 2147483. The default is <b>0 seconds</b> .

**Defaults**                    **10 minutes** for console line; **30 minutes** for VTY lines; **0 seconds**

**Command Modes**            LINE

**Command History**            This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

**Usage Information**            To remove the time interval, enter `exec-timeout 0 0`.

**Example**                        Dell con0 is now available  
 Press RETURN to get started.  
 Dell>

## exit

Return to the lower command mode.

**Syntax**                        `exit`

**Command Modes**

- EXEC Privilege
- CONFIGURATION
- LINE, INTERFACE
- TRACE-LIST
- PROTOCOL GVRP
- SPANNING TREE
- MULTIPLE SPANNING TREE
- MAC ACCESS LIST
- ACCESS-LIST

- AS-PATH ACL
- COMMUNITY-LIST
- PREFIX-LIST
- ROUTER OSPF
- ROUTER RIP
- ROUTER ISIS
- ROUTER BGP

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

### Related Commands

[end](#) — returns to EXEC Privilege mode.

## ftp-server enable

Enable FTP server functions on the system.

**Syntax** `ftp-server [vrf vrf-name] enable`

**Parameters** `vrf vrf-name` Enter the keyword `vrf` and then the name of the VRF to enable the FTP server to listen to that VRF instance.

**NOTE:** Use this attribute to specify the VRF that is used by the FTP server to accept client connections. If no VRF is specified, then the default VRF is used.

**Defaults** Disabled

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.4(0.0)	Added support for VRF.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

**Example**

```
morpheus% ftp 10.31.1.111
Connected to 10.31.1.111.

```

# ftp-server topdir

Specify the top-level directory to be accessed when an incoming FTP connection request is made.

**Syntax** `ftp-server topdir directory`

**Parameters** **directory** Enter the directory path.

**Defaults** The internal flash is the default directory.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

**Usage Information** After you enable FTP server functions with the `ftp-server enable` command, Dell Networking recommends specifying a top-level directory path. Without a top-level directory path specified, the Dell Networking OS directs users to the flash directory when logging in to the FTP server.

**Related Commands** [ftp-server enable](#) — enables FTP server functions on the E-Series.

[ftp-server username](#) — sets a username and password for incoming FTP connections to the E-Series.

## ftp-server username

Create a user name and associated password for incoming FTP server sessions.

**Syntax** `ftp-server username username password [encryption-type]  
password`  
To delete a user name and its password, use the `no ftp-server username username` command.

**Parameters**

<b><i>username</i></b>	Enter a text string up to 40 characters long as the user name.
<b><i>password</i> <i>password</i></b>	Enter the keyword <code>password</code> then a string up to 40 characters long as the password. Without specifying an encryption type, the password is unencrypted.
<b><i>encryption-type</i></b>	(OPTIONAL) After the keyword <code>password</code> , enter one of the following numbers: <ul style="list-style-type: none"><li>• 0 (zero) for an unencrypted (clear text) password</li><li>• 7 (seven) for a hidden text password</li></ul>

**Defaults** Not enabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

# hostname

Set the host name of the system.

**Syntax** `hostname name`

**Parameters** **name** Enter a text string, up to 32 characters long.

**Defaults** **Dell**

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.

8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

**Usage Information** The hostname is used in the prompt.

# ip ftp password

Specify a password for outgoing FTP connections.

**Syntax** `ip ftp password [encryption-type] password`

To remove a password and return to the default setting, use the `no ip ftp password [password]` command.

**Parameters*****encryption-type***

(OPTIONAL) Enter one of the following numbers:

- 0 (zero) for an unencrypted (clear text) password
- 7 (seven) for a hidden text password

***password***

Enter a string up to 40 characters as the password.

**Defaults**

Not configured.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

**Usage Information**

The password is listed in the configuration file; you can view the password by entering the `show running-config ftp` command.

Use the `ip ftp password` command when you use the `ftp: password` parameter in the `copy` command.

**Related Commands**

[copy](#) — copy files.

[ip ftp username](#) — sets the user name for the FTP sessions.

## ip ftp vrf

Configures an FTP client with a VRF that is used to connect to the FTP server.

**Syntax** `ip ftp [vrf vrf-name]`  
To undo the FTP client configuration, use the `ip ftp [vrf vrf-name]` command.

**Parameters**

<b>vrf vrf-name</b>	Enter the keyword <code>vrf</code> and then the name of the VRF to specify the VRF that is used by the FTP client.
---------------------	--

**Defaults** Disabled

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.0)	Introduced on the Z9500.
9.4(0.0)	Introduced on the S-Series and Z9000.

**Usage Information** Use this command to make the FTP clients VRF-aware. The VRF name that you specify is used by the FTP client to reach the FTP server. If no VRF name is specified, then the default VRF is used.

## ip ftp source-interface

Specify an interface's IP address as the source IP address for FTP connections.

**Syntax** `ip ftp source-interface interface`  
To delete an interface, use the `no ip ftp source-interface interface` command.

**Parameters**

<b>interface</b>	Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li></ul>
------------------	--

- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- For a tunnel interface, enter the keyword `tunnel`.

**Defaults** The IP address on the system that is closest to the Telnet address is used in the outgoing packets.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

<b>Version 9.0.2.0</b>	Introduced on the S6000.
<b>Version 8.3.19.0</b>	Introduced on the S4820T.
<b>Version 8.3.11.1</b>	Introduced on the Z9000.
<b>Version 8.3.7.0</b>	Introduced on the S4810.
<b>Version 8.5.1.0</b>	Added support for 4-port 40G line cards on ExaScale.
<b>Version 8.2.1.0</b>	Increased number of VLANs on ExaScale to 4094 (was 2094).
<b>Version 8.1.1.0</b>	Introduced on the E-Series ExaScale.
<b>Version 7.6.1.0</b>	Introduced on the S-Series.
<b>Version 7.5.1.0</b>	Introduced on the C-Series.
<b>E-Series</b>	Original command.

**Related Commands** [copy](#) — copies files from and to the switch.

## ip ftp username

Assign a user name for outgoing FTP connection requests.

**Syntax** `ip ftp username username`

To return to anonymous FTP connections, use the `no ip ftp username [username]` command.

**Parameters**                      **username**                      Enter a text string as the user name up to 40 characters long.

**Defaults**                              No user name is configured.

**Command Modes**                      CONFIGURATION

**Command History**                      This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

**Usage Information**                      Configure a password with the `ip ftp password` command.

**Related Commands**                      [ip ftp password](#) — sets the password for FTP connections.

## ip telnet server enable

Enable the Telnet server on the switch.

**Syntax**                                      `ip telnet server enable`  
To disable the Telnet server, use the `no ip telnet server enable` command.

**Defaults**                                      Enabled

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.1.1.0	Introduced on the E-Series.

**Related Commands** [ip ssh server](#) — enables the secure shell (SSH) server on the system.

## ip telnet server vrf

Configures the TELNET server on either a specific VRF or a management VRF.

### S4820T

**Syntax** `ip telnet server vrf {management | vrf-name}`  
To undo the TELNET server configuration, use the `no ip telnet server [vrf vrf-name]` command.

**Parameters**

<b>vrf management</b>	Enter the keyword <code>vrf</code> followed by the keyword <code>management</code> to specify a management VRF that is used by the TELNET server.
<b>vrf vrf-name</b>	Enter the keyword <code>vrf</code> and then the name of the VRF to specify the VRF that is used by the TELNET server.

**Defaults** Disabled

**Command Modes** CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.0)	Introduced on the Z9500.
9.4.(0.0)	Introduced on the S-Series and Z9000.

## Usage Information

You can enable the TELNET server on either a management VRF or a user-defined VRF but not both. If you do not specify a VRF name, then the TELNET server is enabled on the default VRF.

## Example

```
Dell(conf)#ip telnet server vrf vrf1
Dell(conf)#no ip telnet server vrf
Dell(conf)#ip telnet server vrf management
Dell(conf)#no ip telnet server vrf
```

# ip telnet source-interface

Set an interface's IP address as the source address in outgoing packets for Telnet sessions.

## Syntax

```
ip telnet source-interface interface
```

To return to the default setting, use the `no ip telnet source-interface [interface]` command.

## Parameters

***interface***

Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For Loopback interfaces, enter the keyword `loopback` then a number from zero (0) to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- For a tunnel interface, enter the keyword `tunnel`.

## Defaults

The IP address on the system that is closest to the Telnet address is used in the outgoing packets.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.5.1.0	Added support for 4-port 40G line cards on ExaScale.
8.2.1.0	Increased number of VLANs on ExaScale to 4094 (was 2094).
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command

**Related Commands** [telnet](#) – telnet to another device.

## ip tftp source-interface

Assign an interface's IP address in outgoing packets for TFTP traffic.

### S4820T

**Syntax** `ip tftp source-interface interface`  
To return to the default setting, use the `no ip tftp source-interface interface` command.

**Parameters**

<b><i>interface</i></b>	Enter the following keywords and slot/port or number information:
-------------------------	---

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.

- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults** The IP address on the system that is closest to the Telnet address is used in the outgoing packets.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4820T.
8.5.1.0	Added support for 4-port 40G line cards on ExaScale.
8.2.1.0	Increased number of VLANs on ExaScale to 4094 (was 2094).
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command

## ip tftp vrf

Configures an TFTP client with a VRF that is used to connect to the TFTP server.

**Syntax** `ip tftp [vrf vrf-name]`  
 To undo the TFTP client configuration, use the `no ip tftp [vrf vrf-name]` command.

<b>Parameters</b>	<b>vrf <i>vrf-name</i></b>	Enter the keyword <code>vrf</code> and then the name of the VRF to specify the VRF that is used by the TFTP client.								
<b>Defaults</b>	Disabled									
<b>Command Modes</b>	CONFIGURATION									
<b>Command History</b>	<p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> <table border="0"> <thead> <tr> <th style="text-align: left;">Version</th> <th style="text-align: left;">Description</th> </tr> </thead> <tbody> <tr> <td>9.7(0.0)</td> <td>Introduced on the S6000-ON.</td> </tr> <tr> <td>9.5(0.0)</td> <td>Introduced on the Z9500.</td> </tr> <tr> <td>9.4.(0.0)</td> <td>Introduced on the S-Series and Z9000.</td> </tr> </tbody> </table>		Version	Description	9.7(0.0)	Introduced on the S6000-ON.	9.5(0.0)	Introduced on the Z9500.	9.4.(0.0)	Introduced on the S-Series and Z9000.

9.7(0.0)	Introduced on the S6000-ON.									
9.5(0.0)	Introduced on the Z9500.									
9.4.(0.0)	Introduced on the S-Series and Z9000.									
<b>Usage Information</b>	Use this command to make the TFTP clients VRF aware. The VRF name that you specify is used by the TFTP client to reach the TFTP server. If no VRF is specified, then the default VRF is used.									
<b>Related Commands</b>	<p><a href="#">ftp-server topdir</a> — sets the directory to be used for incoming FTP connections.</p> <p><a href="#">ftp-server username</a> — sets a username and password for incoming FTP connections.</p>									

## line

Enable and configure console and virtual terminal lines to the system. This command accesses LINE mode, where you can set the access conditions for the designated line.

<b>Syntax</b>	<code>line {aux 0   console 0   vty <i>number</i> [<i>end-number</i>] }</code>	
<b>Parameters</b>	<b>aux 0</b>	Enter the keyword <b>aux 0</b> to configure the auxiliary terminal connection.
	<b>console 0</b>	Enter the keyword <code>console 0</code> to configure the console port. The console option for the S-Series is <code>&lt;0-0&gt;</code> .
	<b>vty <i>number</i></b>	Enter the keyword <code>vty</code> then a number from 0 to 9 to configure a virtual terminal line for remote sessions. The system supports 10 remote sessions.
	<b><i>end-number</i></b>	(OPTIONAL) Enter a number from 1 to 9 as the last virtual terminal line to configure. You can configure multiple lines at one time.

<b>Defaults</b>	Not configured																				
<b>Command Modes</b>	CONFIGURATION

## login concurrent-session

Configures the limit of concurrent sessions for all users on console and virtual terminal lines.

<b>Syntax</b>	<pre>login concurrent-session {limit <i>number-of-sessions</i>   clear-line enable}</pre> <pre>no login concurrent-session {limit <i>number-of-sessions</i>   clear-line enable}</pre>
---------------	--

## Parameters

**limit *number-of-sessions*** Sets the number of concurrent sessions that any user can have on console and virtual terminal lines. The range is from 1 to 12 (10 VTY lines, one console, and one AUX line).

**clear-line enable** Enables you to clear your existing sessions.

## Defaults

Not configured. You can use all the available sessions.

## Command Modes

CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.8(0.0)	Introduced on the S4810, S4820, S4048-ON, S3048-ON, S5000, S6000, S6000-ON, and Z9500.

## Usage Information

You must have either the System Administrator or Security Administrator privileges to configure login concurrent-session limit or to enable clear-line.

To limit the number of concurrent sessions that any user can have on console, auxiliary, and virtual terminal lines, use the `login concurrent-session limit number-of-sessions` command.

If the `login concurrent-session clear-line enable` command is configured, you are provided with an option to clear any of your existing sessions after a successful login authentication. When you reach the maximum concurrent session limit, you can still log in by clearing any of your existing sessions.

## Example

The following example shows how to limit the number of concurrent sessions that any user can have to four:

```
Dell(conf)#login concurrent-session limit 4
Dell(conf)#
```

The following example shows how to use the `login concurrent-session clear-line enable` command.

```
Dell(conf)#login concurrent-session clear-line enable
Dell(conf)#
```

When you try to log in, the following message appears with all your existing concurrent sessions, providing an option to close any one of the existing sessions:

```
$ telnet 10.11.178.14
Trying 10.11.178.14...
Connected to 10.11.178.14.
Escape character is '^]'.

```

```

Login: admin
Password:
Current sessions for user admin:
Line           Location
2 vty 0        10.14.1.97
3 vty 1        10.14.1.97
Clear existing session? [line number/Enter to cancel]:

```

When you try to create more than the permitted number of sessions, the following message appears, prompting you to close one of your existing sessions. Close any of your existing sessions to log in to the system.

```

$ telnet 10.11.178.14
Trying 10.11.178.14...
Connected to 10.11.178.14.
Escape character is '^]'.
Login: admin
Password:
Maximum concurrent sessions for the user reached.
Current sessions for user admin:
Line           Location
2 vty 0        10.14.1.97
3 vty 1        10.14.1.97
4 vty 2        10.14.1.97
5 vty 3        10.14.1.97
Clear existing session? [line number/Enter to cancel]:

```

#### Related Commands

[login statistics](#) — Enable and configure user login statistics on console and virtual terminal lines.

[show login statistics](#) — Displays login statistics of users who have used the console or virtual terminal lines to log in to the system.

## login statistics

Enable and configure user login statistics on console and virtual terminal lines.

#### Syntax

```

login statistics {enable | time-period days}

no login statistics {enable | time-period days}

```

#### Parameters

<b>enable</b>	Enables user login statistics. By default, the system displays the login statistics for the last 30 days.
<b>time-period <i>days</i></b>	Sets the number of days for which the system stores the user login statistics. The range is from 1 to 30.

#### Defaults

Not configured

## Command Modes

CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.8(0.0)	Introduced on the S4810, S4820, S5000, S6000, S6000-ON, and Z9500.

## Usage Information

Only the system and security administrators can configure login activity tracking and view the login activity details of other users.

If you enable user login statistics, the system displays the last successful login details of the current user and the details of any failed login attempts by others.

If you use the `login statistics time-period days` command to set a custom time period, the system only reports the login statistics during that interval.

**NOTE:** Login statistics is not applicable for login sessions that do not use user names for authentication. For example, the system does not report login activity for a telnet session that prompts only a password field.

## Example

When you log into the system, it displays a message similar to the following:

```
$ telnet 10.11.178.14
Trying 10.11.178.14...
Connected to 10.11.178.14.
Escape character is '^]'.
Login: admin
Password:
Last successful login: Mon Feb 16 04:36:11 2015 Line vty0
( 10.14.1.97 ).
There were 2 unsuccessful login attempt(s) since the last
successful login.
There were 3 unsuccessful login attempt(s) for user admin in
last 30 day(s).
```

The preceding message shows that the user had previously logged in to the system using the VTY line from 10.14.1.97. It also displays the number of unsuccessful login attempts since the last login and the number of unsuccessful login attempts in the last 30 days.

```
$ telnet 10.11.178.14
Trying 10.11.178.14...
Connected to 10.11.178.14.
Escape character is '^]'.
Login: admin
Password:
Last successful login: Wed Feb 5 14:05:28 IST 2015 on console
There were 2 unsuccessful login attempt(s) since the last
successful login.
There were 3 unsuccessful login attempt(s) for user admin in
last 12 day(s).
```

The preceding message shows that the user had previously logged in to the system using the console line. It also displays the number of unsuccessful login attempts since the last login and the number of unsuccessful login attempts during a custom time period.

**Related  
Commands**

[login concurrent-session](#) — Configures the limit of concurrent sessions for all users on console and virtual terminal lines.

[show login statistics](#) — Displays login statistics of users who have used the console or virtual terminal lines to log in to the system.

## motd-banner

Enable a message of the day (MOTD) banner to appear when you log in to the system.

**Syntax**

`motd-banner`

To disable the MOTD banner, use the `no motd-banner` command.

**Defaults**

Enabled on all lines.

**Command  
Modes**

LINE

**Command  
History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series ExaScale
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command

# ping

Test connectivity between the system and another device by sending echo requests and waiting for replies.

## Syntax

```
ping [host | ip-address | ipv6-address] [count {number | continuous}] [datagram-size] [timeout] [source (ip src-ipv4-address) | interface] [tos] [df-bit (y|n)] [validate-reply(y|n)] [outgoing-interface] [pattern pattern] [sweep-min-size] [sweep-max-size] [sweep-interval] [ointerface (ip src-ipv4-address) | interface]
```

## Parameters

<b>host</b>	(OPTIONAL) Enter the host name of the devices to which you are testing connectivity.
<b>ip-address</b>	(OPTIONAL) Enter the IPv4 address of the device to which you are testing connectivity. The address must be in the dotted decimal format.
<b>ipv6-address</b>	(OPTIONAL) Enter the IPv6 address, in the x:x:x:x:x format, to which you are testing connectivity.  <b>NOTE:</b> The :: notation specifies successive hexadecimal fields of zeros.
<b>count</b>	Enter the number of echo packets to be sent. The default is <b>5</b> . <ul style="list-style-type: none"><li>• number: from 1 to 2147483647</li><li>• continuous: transmit echo request continuously</li></ul>
<b>datagram size</b>	Enter the ICMP datagram size. The range is from 36 to 15360 bytes. The default is <b>100</b> .
<b>timeout</b>	Enter the interval to wait for an echo reply before timing out. The range is from 0 to 3600 seconds. The default is <b>2 seconds</b> .
<b>source</b>	Enter the IPv4 or IPv6 source ip address or the source interface. For IPv6 addresses, you may enter global addresses only. Enter the IP address in A.B.C.D format. <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li><li>• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li><li>• For a Tunnel interface, enter the keyword <code>tunnel</code> then a number from 1 to 16383.</li></ul>

<b>tos</b>	(IPv4 only) Enter the type of service required. The range is from 0 to 255. The default is <b>0</b> .
<b>df-bit</b>	(IPv4 only) Enter <b>Y</b> or <b>N</b> for the "don't fragment" bit in IPv4 header. <ul style="list-style-type: none"> <li>• <b>N</b>: Do not set the "don't fragment" bit.</li> <li>• <b>Y</b>: Do set "don't fragment" bit</li> </ul> Default is <b>No</b> .
<b>validate-reply</b>	(IPv4 only) Enter <b>Y</b> or <b>N</b> for reply validation. <ul style="list-style-type: none"> <li>• <b>N</b>: Do not validate reply data.</li> <li>• <b>Y</b>: Do validate reply data.</li> </ul> Default is <b>No</b> .
<b>outgoing-interface</b>	(IPv6 link-local address) Enter the outgoing interface for ping packets to a destination link-local address.
<b>pattern pattern</b>	(IPv4 only) Enter the IPv4 data pattern. Range: 0-FFFF. Default: <b>0xABCD</b> .
<b>sweep-min-size</b>	Enter the minimum size of datagram in sweep range. The range is from 52 to 15359 bytes.
<b>sweep-max-size</b>	Enter the maximum size of datagram in sweep range. The range is from 53 to 15359 bytes.
<b>sweep-interval</b>	Enter the incremental value for sweep size. The range is from 1 to 15308 seconds.
<b>interface</b>	(IPv4 only) Enter the outgoing interface for multicast packets. Enter the IP address in A.B.C.D format. <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li> <li>• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> </ul>

**Defaults**

none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

<b>Version 9.0.2.0</b>	Introduced on the S6000.
<b>Version 9.0.0.0</b>	Introduced on the Z9000.
<b>Version 8.3.19.0</b>	Introduced on the S4820T.  Added support for the <code>outgoing-interface</code> option for link-local IPv6 addressing on the S4820T.
<b>Version 8.3.12.0</b>	Added support for the <code>outgoing-interface</code> option for link-local IPv6 addressing on the S4810.
<b>Version 8.3.11.1</b>	Introduced on the Z9000.
<b>Version 8.3.7.0</b>	Introduced on the S4810.
<b>Version 8.5.1.0</b>	Added support for 4-port 40G line cards on the ExaScale.
<b>Version 8.4.1.0</b>	IPv6 pinging available on management interface.
<b>Version 8.3.1.0</b>	Introduced extended ping options.
<b>Version 8.2.1.0</b>	Introduced on the E-Series ExaScale (IPv6).
<b>Version 8.1.1.0</b>	Introduced on the E-Series ExaScale (IPv4).
<b>Version 7.9.1.0</b>	Introduced VRF.
<b>Version 7.6.1.0</b>	Introduced on the S-Series.
<b>Version 7.5.1.0</b>	Introduced on the C-Series.
<b>Version 7.4.1.0</b>	Added support for IPv6 address on the E-Series.

#### Usage Information

When you enter the `ping` command without specifying an IP/IPv6 address (Extended Ping), you are prompted for a target IP/IPv6 address, a repeat count, a datagram size (up to 1500 bytes), a timeout (in seconds), and for Extended Commands.

The following table provides descriptions for the `ping` command status response symbols displayed in the output.

Symbol	Description
!	Each exclamation point indicates receipt of a reply.
.	Each period indicates the network server timed out while waiting for a reply.
U	A destination unreachable error PDU was received.
Q	Source quench (destination too busy).
M	Could not fragment.
?	Unknown packet type.
&	Packet lifetime exceeded.

#### Example (IPv4)

```
Dell#ping 172.31.1.255
Type Ctrl-C to abort.
```

```

Sending 5, 100-byte ICMP Echos to 172.31.1.255, timeout is 2
seconds:
Reply to request 1 from 172.31.1.208 0 ms
Reply to request 1 from 172.31.1.216 0 ms
Reply to request 1 from 172.31.1.205 16 ms
::
Reply to request 5 from 172.31.1.209 0 ms
Reply to request 5 from 172.31.1.66 0 ms
Reply to request 5 from 172.31.1.87 0 ms
Dell#

```

#### Example (IPv6)

```

Dell#ping 100::1

Type Ctrl-C to abort.

Sending 5, 100-byte ICMP Echos to 100::1, timeout is 2 seconds:
!!!!
Success rate is 100.0 percent (5/5), round-trip min/avg/max =
0/0/0 (ms)
Dell#

```

## reload

Reboot Dell Networking Operating System (OS).

<b>Syntax</b>	<code>reload [conditional <i>nvr</i>ram-cfg-change]</code>	
<b>Parameters</b>	<b>conditional <i>nvr</i>ram-cfg- change</b>	Reload if the condition is true. A configuration change to the nvr
<b>Command Modes</b>	EXEC Privilege	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .	

The following is a list of the Dell Networking OS version history for this command.

<b>Version</b>	<b>Description</b>
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>9.0.0.0</b>	Introduced on the Z9000.
<b>9.1(0.0)</b>	Added 'conditional' parameter.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.

Version	Description
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

### Usage Information

If there is a change in the configuration, FTOS prompts you to save the new configuration. Or you can save your running configuration with the `copy running-config` command. Use the conditional parameter if any configuration changes made to the nvram, such as stack-group and fanout configurations, must be saved.

## send

Send messages to one or all terminal line users.

**Syntax** `send [*] | [line ] | [console] | [vty]`

### Parameters

<b>*</b>	Enter the asterisk character <code>*</code> to send a message to all tty lines.
<b>line</b>	Send a message to a specific line. The range is from 0 to 11.
<b>console</b>	Enter the keyword <code>console</code> to send a message to the primary terminal line.
<b>vty</b>	Enter the keyword <code>vty</code> to send a message to the virtual terminal.

**Defaults** none

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

Version	Description
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.5.1.0	Introduced on the E-Series.

**Usage Information** Messages can contain an unlimited number of lines; however, each line is limited to 255 characters. To move to the next line, use <CR>. To send the message use CTR-Z; to abort a message, use CTR-C.

## service timestamps

To debug and log messages, add time stamps. This command adds either the uptime or the current time and date.

**Syntax** `service timestamps [debug | log] [datetime [localtime] [msec] [show-timezone] | uptime]`  
 To disable timestamping, use the `no service timestamps [debug | log]` command.

**Parameters**

- debug** (OPTIONAL) Enter the keyword `debug` to add timestamps to debug messages.
- log** (OPTIONAL) Enter the keyword `log` to add timestamps to log messages with severity from 0 to 6.
- datetime** (OPTIONAL) Enter the keyword `datetime` to have the current time and date added to the message.
- localtime** (OPTIONAL) Enter the keyword `localtime` to include the localtime in the timestamp.
- msec** (OPTIONAL) Enter the keyword `msec` to include milliseconds in the timestamp.
- show-timezone** (OPTIONAL) Enter the keyword `show-timezone` to include the time zone information in the timestamp.
- uptime** (OPTIONAL) Enter the keyword `uptime` to have the timestamp based on time elapsed since system reboot.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

**Usage Information** If you do not specify parameters and enter service timestamps, it appears as service timestamps debug uptime in the running-configuration.  
To view the current options set for the `service timestamps` command, use the `show running-config` command.

## show alarms

View alarms currently active in the system.

**Syntax** `show alarms [threshold]`

**Parameters** **threshold** (OPTIONAL) Enter the keyword `threshold` to display the temperature thresholds in Celcius for each level.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

#### Example

```
Dell# show alarms
-- Minor Alarms --
Alarm Type Duration
-----
RPM 0 PEM A failed or rmvd 7 hr, 37 min
SFM 0 PEM A failed or rmvd 7 hr, 37 min
SFM 1 PEM A failed or rmvd 7 hr, 37 min
SFM 2 PEM A failed or rmvd 7 hr, 37 min
SFM 3 PEM A failed or rmvd 7 hr, 37 min
SFM 4 PEM A failed or rmvd 7 hr, 37 min
SFM 5 PEM A failed or rmvd 7 hr, 37 min
SFM 6 PEM A failed or rmvd 7 hr, 37 min
SFM 7 PEM A failed or rmvd 7 hr, 36 min
stack-unit 1 PEM A failed or rmvd 7 hr, 36 min
stack-unit 4 PEM A failed or rmvd 7 hr, 36 min
only 8 SFMs in chassis 7 hr, 35 min

-- Major Alarms --

Alarm Type Duration
-----
No major alarms
Dell#
```

## show cam-acl-vlan

Display the block sizes allocated for the VLAN CAM ACL.

### S4820T

**Syntax**            show cam-acl-vlan

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
Version 9.1.(0.0)	Introduced on S4810.
Version 8.3.19.0	Introduced on the S4820T.

## show command-history

Display a buffered log of all commands all users enter along with a time stamp.

**Syntax** `show command-history`

**Defaults** none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series and E-Series.

**Usage Information** One trace log message is generated for each command. No password information is saved to this file. A command-history trace log is saved to a file after failover. Dell Networking TAC analyzes this file to help identify the root cause of it.

**Example**

```
Dell#show command-history
[11/20 15:47:22]: CMD-(CLI):[service password-encryption]by
default from console
[11/20 15:47:22]: CMD-(CLI):[service password-encryption

Dell#

```

## show command-tree

Display the entire CLI command tree, and optionally, display the utilization count for each command and its options.

<b>Syntax</b>	<code>show command-tree [count   no]</code>	
<b>Parameters</b>	<b>count</b>	Display the command tree with a usage counter for each command.
	<b>no</b>	Display all of the commands that may be preceded by the keyword <code>no</code> , which is the keyword used to remove a command from the running-configuration.
<b>Defaults</b>	none	
<b>Command Modes</b>	<ul style="list-style-type: none"><li>EXEC</li><li>EXEC Privilege</li></ul>	

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.2.1.0	Introduced.

**Usage Information** Reload the system to reset the command-tree counters.

**Example**

```
Dell#show command-tree count
!
Enable privilege mode:

enable command usage:3
  <0-15> option usage: 0

exit  command usage:1

show  command-tree command usage:9
count option usage: 3

show version command usage:1
```

```

!
Global configuration mode:

aaa authentication enable command usage:1
  WORD    option usage: 1
  default option usage: 0
  enable  option usage: 0
  line    option usage: 0
  none    option usage: 0
  radius  option usage: 1
  tacacs+ option usage: 0

```

## show cpu-traffic-stats

View the CPU traffic statistics.

<b>Syntax</b>	<code>show cpu-traffic-stats [port number   all   cp ]</code>
<b>Parameters</b>	<p><b>port number</b> (OPTIONAL) Enter the port number to display traffic statistics on that port only. The range is from 1 to 1568.</p> <p><b>all</b> (OPTIONAL) Enter the keyword <code>all</code> to display traffic statistics on all the interfaces receiving traffic, sorted based on the traffic.</p> <p><b>cp</b> (OPTIONAL) Enter the keyword <code>cp</code> to display traffic statistics on the specified CPU.</p>
<b>Defaults</b>	<b>all</b>
<b>Command Modes</b>	EXEC
<b>Command History</b>	<p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p>

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.6.1.0	Introduced on the S-Series.

Version	Description
7.5.1.0	Introduced on the C-Series
6.2.1.1	Introduced on the E-Series.

**Usage Information**

Traffic statistics are sorted on a per-interface basis; the interface receiving the most traffic is displayed first. All CPU and port information is displayed unless a specific port or CPU is specified. Traffic information is displayed for router ports only; not for management interfaces. The traffic statistics are collected only after the debug `cpu-traffic-stats` command is executed; not from the system bootup.

**NOTE:** After debugging is complete, use the `no debug cpu-traffic-stats` command to shut off traffic statistics collection.

**Example**

```
Dell#show cpu-traffic-stats
Processor : CP
-----
Received 100% traffic on TenGigabitEthernet 8/2 Total packets:
100
LLC:0, SNAP:0, IP:100, ARP:0, other:0
Unicast:100, Multicast:0, Broadcast:0
Processor : RP1
-----
Received 62% traffic on TenGigabitEthernet 8/2 Total packets:
500
LLC:0, SNAP:0, IP:500, ARP:0, other:0
Unicast:500, Multicast:0, Broadcast:0
Received 37% traffic on TenGigabitEthernet 8/1 Total packets:
300
LLC:0, SNAP:0, IP:300, ARP:0, other:0
Unicast:300, Multicast:0, Broadcast:0
Processor : RP2
-----
No CPU traffic statistics.
Dell#
```

## show debugging

View a list of all enabled debugging processes.

**Syntax** `show debugging`

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

### Example

```
Dell#show debug
Generic IP:
  IP packet debugging is on for
  ManagementEthernet 0/0
  Port-channel 1-2
  Port-channel 5
  GigabitEthernet 4/0-3,5-6,10-11,20
  GigabitEthernet 5/0-1,5-6,10-11,15,17,19,21
  ICMP packet debugging is on for
  GigabitEthernet 5/0,2,4,6,8,10,12,14,16
Dell#
```

## show environment

View S-Series and Z-Series system component status (for example, temperature or voltage).

**Syntax** `show environment [all | fan | stack-unit unit-id | pem]`

### Parameters

<b>all</b>	Enter the keyword <code>all</code> to view all components.
<b>fan</b>	Enter the keyword <code>fan</code> to view information on the fans. The output of this command is chassis dependent.
<b>stack-unit <i>unit-id</i></b>	Enter the keyword <code>stack-unit</code> then the <code>unit-id</code> to display information on a specific stack member. The range is from 0 to 1.
<b>pem</b>	Enter the keyword <code>pem</code> to view only information on power entry modules.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.8.1.0	The output of the <code>show environment fan</code> command for the S-Series is changed to display fan speeds instead of showing the fan status as up or down.

**Usage Information**

The following example shows the output of the `show environment` command.

**Example (all)**

```
Dell#show environment

-- Fan Status --

## show inventory

Display the S-Series or Z-Series switch type, components (including media), and Dell Networking Operating System (OS), including hardware identification numbers and configured protocols.

**Syntax** `show inventory [media slot]`

**Parameters**

**media slot** (OPTIONAL) Enter the keyword `media` then the stack ID of the stack member for which you want to display pluggable media inventory.

**NOTE:** This parameter is available but not supported in Dell Networking Operating System version 8.3.11.4. Because stacking is not supported, if you use this parameter, the output displays "Media not present or accessible" (refer to the *Usage Information* section).

**Defaults** none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.4	Output expanded to include Piece Part ID (PPID) and eSR4 optics.
8.3.11.1	Introduced on the Z9000.
7.6.1.0	Introduced this version of the command for S-Series. S-Series output differs from E-Series.

**Usage Information** If there are no fiber ports in the unit, just the header under *show inventory media* displays. If there are fiber ports but no optics inserted, the output displays *Media not present or accessible*.

**Example (S6000)**

```
Dell#show inventory
System Type           : S6000
System Mode           : 1.0
Software Version      : 9-4(0-168)
```

## Related Commands

- [show interfaces](#) — displays the interface configuration.

## show login statistics

Displays login statistics of users who have used the console or virtual terminal lines to log in to the system.

**Syntax** `show login statistics [[unsuccessful-attempts [user login-id]  
[time-period days]] | [all | user login-id]]`

### Parameters

**all** (Optional)Displays the login statistics of all users in the last 30 days or the custom defined time period.

***user login-id*** (Optional)Displays the login statistics of a specific user in the last 30 days or the custom defined time period. When you use it with the `unsuccessful-attempts` keyword, the system displays the number of failed login attempts by a specific user in the last 30 days or the custom defined time period

**unsuccessful-attempts** (Optional)Displays the number of failed login attempts by the current user in the last 30 days or the custom defined time period.

**time-period days** (Optional)Displays the number of failed login attempts by the current user in the specified period.

**Defaults**

None

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.8(0.0)	Introduced on the S4810, S4820, S5000, S6000, S6000-ON, and Z9500.

**Usage Information**

To view the successful and failed login details of the current user in the last 30 days or the custom defined period, use the `show login statistics` command.

To view the successful and failed login details of all users in the last 30 days or the custom defined period, use the `show login statistics all` command. You can use this command only if you have system or security administrator rights.

To view the successful and failed login details of a specific user in the last 30 days or the custom defined time period, use the `show login statistics user user-id` command. If you have system or security administrator rights, you can view the login statistics of other users. If you do not have system or security administrator rights, you can view your login statistics but not the login statistics of others.

**NOTE:** By default, these commands display the details for the last 30 days. If you set a custom-defined time period for login statistics using the `login statistics time-period days` command, these commands display details only for that period.

**Example**

The following is sample output of the `show login statistics` command.

```
Dell#show login statistics
-----
---
User: admin
Last login time: Mon Feb 16 04:40:00 2015
Last login location: Line vty0 ( 10.14.1.97 )
Unsuccessful login attempt(s) since the last successful login:
0
Unsuccessful login attempt(s) in last 30 day(s): 3
```

-----  
---  
The following is sample output of the show login statistics all command.

```
Dell#show login statistics all
```

```
-----  
---  
User: admin  
Last login time: Mon Feb 16 04:40:00 2015  
Last login location: Line vty0 ( 10.14.1.97 )  
Unsuccessful login attempt(s) since the last successful login:  
0  
Unsuccessful login attempt(s) in last 7 day(s): 3  
-----  
---
```

```
-----  
---  
User: secadm  
Last login time: Mon Feb 16 04:45:29 2015  
Last login location: Line vty0 ( 10.14.1.97 )  
Unsuccessful login attempt(s) since the last successful login:  
0  
Unsuccessful login attempt(s) in last 7 day(s): 0  
-----  
---
```

The following is sample output of the show login statistics user *user-id* command.

```
Dell#show login statistics user admin
```

```
-----  
---  
User: admin  
Last login time: Mon Feb 16 04:40:00 2015  
Last login location: Line vty0 ( 10.14.1.97 )  
Unsuccessful login attempt(s) since the last successful login:  
0  
Unsuccessful login attempt(s) in last 11 day(s): 3  
-----  
---
```

The following is sample output of the show login statistics unsuccessful-attempts command.

```
Dell#show login statistics unsuccessful-attempts  
There were 3 unsuccessful login attempt(s) for user admin in  
last 30 day(s).
```

The following is sample output of the show login statistics unsuccessful-attempts time-period *days* command.

```
Dell#show login statistics unsuccessful-attempts time-period 15  
There were 0 unsuccessful login attempt(s) for user admin in  
last 15 day(s).
```

The following is sample output of the `show login statistics unsuccessful-attempts user login-id` command.

```
Dell#show login statistics unsuccessful-attempts user admin
There were 3 unsuccessful login attempt(s) for user admin in
last 12 day(s).
```

## Related Commands

[login statistics](#) — Enable and configure user login statistics on console and virtual terminal lines.

[login concurrent-session](#) — Configures the limit of concurrent sessions for all users on console and virtual terminal lines.

## show memory

View current memory usage on the switch.

**Syntax** `show memory [stack-unit id]`

**Parameters**

<b>stack-unit id</b>	(OPTIONAL) Enter the keyword <code>stack-unit</code> then the stack unit ID of the S-Series stack member to display memory information on the designated stack member. The unit ID range for the S4820T is from 0 to 11.
----------------------	--

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced this version of the command for the S-Series.

**Usage Information** The output for `show memory` displays the memory usage of LP part (sysdlp) of the system. The sysdlp is an aggregate task that handles all the tasks running on the S-Series' CPU.

**Example**

```
Dell#show memory stack-unit 1
Statistics On Unit 1 Processor
=====
Total(b)  Used(b)  Free(b)   Lowest(b)  Largest(b)
268435456 4010354 264425102 264375410 264425102
```

**Example (S4820T)**

```
Dell#show memory stack 0
Statistics On Unit 0 Processor
=====
Total(b)  Used(b)  Free(b)   Lowest(b)  Largest(b)
2147483648 4322398 2143161250 2142548382 2143161250
Dell#
```

## show processes cpu

Display CPU usage information based on processes running.

**Syntax** `show processes cpu [management-unit 1-99 [details] | stack-unit id | summary | [stack-unit id]]`

**Parameters**

<b>management-unit 1-99 [details]</b>	(OPTIONAL) Display processes running in the control processor. The 1-99 variable sets the number of tasks to display in order of the highest CPU usage in the past five (5) seconds. Add the keyword <code>details</code> to display all running processes (except sysdlp). Refer to Example (management-unit).
<b>stack-unit id</b>	(OPTIONAL) Enter the keyword <code>stack-unit</code> then the stack member ID.  As an option of the <code>show processes cpu</code> command, this option displays CPU usage for the designated stack member. Or, as an option of the <code>command</code> , this option limits the output of memory statistics to the designated stack member. The unit ID range for the S4820T is from 0 to 11.  Refer to Example (stack-unit).
<b>summary</b>	(OPTIONAL) Enter the keyword <code>summary</code> to view CPU utilization of processes related to stack-unit processing.

**Command Modes**

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.7.1.0	Added the keywords <code>management-unit</code> [details].
7.6.1.0	Introduced on the S-Series.

**Related Commands**

[show hardware layer2 acl](#) — displays Layer 2 ACL data for the selected stack member and stack member port-pipe.

[show hardware layer3](#) — displays Layer 3 ACL or QoS data for the selected stack member and stack member port-pipe.

[show hardware stack-unit](#) — displays the data plane or management plane input and output statistics of the designated component of the designated stack member.

[show hardware system-flow](#) — displays Layer 3 ACL or QoS data for the selected stack member and stack member port-pipe.

[show interfaces stack-unit](#) — displays information on all interfaces on a specific S-Series stack member.

[show processes memory \(S-Series\)](#) — displays CPU usage information based on processes running in an S-Series.

## show processes ipc flow-control

Display the single window protocol queue (SWPQ) statistics.

<b>Syntax</b>	<code>show processes ipc flow-control [cp]</code>	
<b>Parameters</b>	<b>cp</b>	(OPTIONAL) Enter the keyword <code>cp</code> to view the control processor's SWPQ statistics.
<b>Defaults</b>	none	
<b>Command Modes</b>	<ul style="list-style-type: none"><li>EXEC</li><li>EXEC Privilege</li></ul>	

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

Field	Description
Cur Len	Current number of messages enqueued
High Mark	Highest number of packets in the queue at any time
#of to / Timeout	Timeout count
#of Retr /Retries	Number of retransmissions
#msg Sent/Msg Sent/	Number of messages sent
#msg Ackd/Ack Rcvd	Number of messages acknowledged
Retr /Available Retra	Number of retries left
Total/ Max Retra	Number of retries allowed

#### Important Points:

- The SWP provides flow control-based reliable communication between the sending and receiving software tasks.
- A sending task enqueues messages into the SWP queue<sup>3</sup> for a receiving task and waits for an acknowledgement.
- If no response is received within a defined period of time, the SWP timeout mechanism resubmits the message at the head of the FIFO queue.
- After retrying a defined number of times, the `SWP-2-NOMORETIMEOUT` timeout message is generated.
- In the S-Series example, a retry (Retries) value of zero indicates that the SWP mechanism reached the maximum number of retransmissions without an acknowledgement.

#### Example (S-Series)

```
Dell#show processes ipc flow-control ?
cp                Control Processor
|                Pipe through a command
```

## show processes memory

Display memory usage information based on processes running in the S-Series or Z-Series system.

**Syntax** `show processes memory {management-unit | stack unit {unit-id | all | summary}}`

#### Parameters

<b>management-unit</b>	Enter the keyword <code>management-unit</code> for CPU memory usage of the stack management unit.
<b>stack unit unit id</b>	Enter the keyword <code>stack unit</code> then a stack unit ID of the member unit for which to display memory usage on the forwarding processor.

- all** Enter the keyword `all` for detailed memory usage on all stack members.
- summary** Enter the keyword `summary` for a brief summary of memory availability and usage on all stack members.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.7.1.0	Added the <code>management-unit</code> option.
7.6.1.0	Introduced on the S-Series.

**Usage Information**

<code>show processes memory output</code> Field	Description
<b>Total:</b>	Total system memory available
<b>MaxUsed:</b>	Total maximum memory used ever (history indicated with time stamp)
<b>CurrentUsed:</b>	Total memory currently in use
<b>CurrentFree:</b>	Total system memory available
<b>SharedUsed:</b>	Total used shared memory
<b>SharedFree:</b>	Total free shared memory
<b>PID</b>	Process ID
<b>Process</b>	Process Name
<b>ResSize</b>	Actual resident size of the process in memory
<b>Size</b>	Process test, stack, and data size
<b>Allocs</b>	Total dynamic memory allocated

```

show processes Description
memory output
Field

Frees          Total dynamic memory freed
Max           Maximum dynamic memory allocated
Current       Current dynamic memory in use

```

The output for the `show process memory` command displays the memory usage statistics running on CP part (sysd) of the system. The sysd is an aggregate task that handles all the tasks running on S-Series' CP.

For the S-Series, the output of the `show memory` command and this command differ based on which FTOS processes are counted.

- In the `show memory` output, the memory size is equal to the size of the application processes.
- In the output of this command, the memory size is equal to the size of the application processes plus the size of the system processes.

### Example

```

Dell#show processes memory stack-unit 1
Total: 268435456, MaxUsed: 2420244, CurrentUsed: 2420244,
CurrentFree:
266015212
TaskName TotalAllocated TotalFreed MaxHeld CurrentHolding
tme      435406             397536   54434   37870

## show software ifm

Display interface management (IFM) data.

<b>Syntax</b>	<code>show software ifm {clients [summary]   ifagt <i>number</i>   ifcb <i>interface</i>   stack-unit <i>unit-ID</i>   trace-flags}</code>	
<b>Parameters</b>	<b>clients</b>	Enter the keyword <code>clients</code> to display IFM client information.
	<b>summary</b>	(OPTIONAL) Enter the keyword <code>summary</code> to display brief information about IFM clients.
	<b>ifagt <i>number</i></b>	Enter the keyword <code>ifagt</code> then the number of an interface agent to display software pipe and IPC statistics.
	<b>ifcb <i>interface</i></b>	Enter the keyword <code>ifcb</code> then one of the following interface IDs then the slot/port information to display interface control block information for that interface: <ul style="list-style-type: none"> <li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> </ul>
	<b>stack-unit <i>unit-ID</i></b>	Enter the keyword <code>stack-unit</code> then the stack member number to display IFM information for that unit. <p> <b>NOTE:</b> This option is only available on the S-Series.</p>
	<b>trace-flags</b>	Enter the keyword <code>trace-flags</code> to display IFM information for internal trace flags.
<b>Defaults</b>	none	
<b>Command Modes</b>	<ul style="list-style-type: none"> <li>• EXEC</li> </ul>	

- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.5.1.0	Added support for 4-port 40G line cards on ExaScale.
7.6.1.0	Introduced for the C-Series and S-Series.

**Example**

```

## show system

Display the status of all stack members or a specific member.

```
Syntax          show system [brief | stack-unit unit-id | stack-ports {status |
                    topology}]
```

## Parameters

<b>brief</b>	(OPTIONAL) Enter the keyword <code>brief</code> to view an abbreviated list of system information.
<b>stack-unit <i>unit-id</i></b>	(OPTIONAL) Enter the keywords <code>stack-unit</code> then the stack member ID for information on that stack member. The unit ID range for the S4820T is from 0 to 11.
<b>stack-ports <i>status</i>   <i>topology</i></b>	(OPTIONAL) Enter the keywords <code>stack-ports</code> for information about the status or topology of the stack ports.

 **NOTE:** This option applies to the S4810 or S4820T system only.

## Command Modes

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.4(0.0)	Added support for the <code>disabled-ports</code> parameter .
9.2(1.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.11.4	The <code>brief</code> parameter no longer displays the current Reload mode. To display Reload mode, use the <code>show reload-type</code> command. Modified the <code>show system stack-unit</code> command output to support Piece Part ID (PPID).
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	The Boot Flash field displays the code level for boot code 2.8.1.1 and newer, while older boot codes display as "Present".
7.7.1.0	Added Master Priority field.
7.6.1.0	Introduced on the S-Series.

Example (show system stack unit – disabled ports)

Example (show system brief)

```
Dell#show system brief

#### Related Commands

- [show version](#) – displays the Dell Networking OS version.
- [show hardware stack-unit](#) – displays the data plane and management plane input and output statistics of a particular stack member.

## show tech-support

Display a collection of data from other `show` commands, necessary for Dell Networking technical support to perform troubleshooting.

#### Syntax

```
show tech-support [stack-unit unit-id | page]
```

#### Parameters

- stack-unit** (OPTIONAL) Enter the keywords `stack-unit` to view CPU memory usage for the stack member designated by `unit-id`. The unit ID range for the S4820T is from 0 to 11.
- page** (OPTIONAL) Enter the keyword `page` to view 24 lines of text at a time. Press the SPACE BAR to view the next 24 lines. Press the ENTER key to view the next line of text.
- When using the pipe command (`|`), enter one of these keywords to filter command output. For details about filtering commands, refer to [CLI Basics](#).
- save** Enter the keyword `save` to save the command output.
- `flash:` Save to local flash drive (`flash://filename`). A maximum of 20 characters.

#### Command Modes

EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced <i>save</i> to the file options.
7.6.1.0	Introduced on the S-Series.

### Usage Information

Without the `page` or `stack-unit` option, the command output is continuous. To interrupt the command output, use Ctrl-z.

The `save` option works with other filtering commands. This allows you to save specific information of a `show` command. The `save` entry must always be the last option. For example: `Dell#show tech-support |grep regular-expression |except regular-expression | find regular-expression | save flash://result`

This display output is an accumulation of the same information that is displayed when you execute one of the following `show` commands:

- `show version`
- `show clock`
- `show running-config`
- `show system stack-ports`
- `show interfaces`
- `show process memory`
- `show process cpu`
- `show file system`
- `show system`
- `show environment`
- `show ip traffic`
- `show ip management route`
- `show ip route summary`
- `show Inventory`
- `show log summary`
- `show command-history (last 20 commands)`
- `show log`

### Example (S-Series)

```
Dell#show tech-support ?
page          Page through output
stack-unit    Unit Number
|            Pipe through a command
<cr>
Dell#show tech-support stack-unit 1 ?
```

```

| Pipe through a command
<cr>
Dell#show tech-support stack-unit 1 | ?
except      Show only text that does not match a pattern
find        Search for the first occurrence of a pattern
grep        Show only text that matches a pattern
no-more     Don't paginate output
save        Save output to a file

Dell#show tech-support stack-unit 1 | save ?
flash:      Save to local file system (flash://filename (max 20
chars) )

Dell#show tech-support stack-unit 1 | save flash://LauraSave
Start saving show command report .....
Dell#

Dell#dir

- [show processes memory \(S-Series\)](#) — displays the memory usage based on running processes.

## ssh-peer-stack-unit

Open an SSH connection to the peer stack-unit.

<b>Syntax</b>	<code>ssh-peer-stack-unit [-l <i>username</i>]</code>
<b>Parameters</b>	<code>-l <i>username</i></code> (OPTIONAL) Enter the keyword <code>-l</code> then your user name. The default is the user name associated with the terminal.
<b>Defaults</b>	Not configured.
<b>Command Modes</b>	<ul style="list-style-type: none"> <li>• EXEC</li> <li>• EXEC Privilege</li> </ul>
<b>Command History</b>	<p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p>

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.0.0	Introduced on the Z9000.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.3.11.1	Introduced on the S-Series.

## telnet

Connect through Telnet to a server. The Telnet client and server in Dell Networking support IPv4 and IPv6 connections. You can establish a Telnet session directly to the router or a connection can be initiated from the router.

 **NOTE:** The Telnet server and client are VRF-aware. Using the `vrf` parameter in this command, you can make a Telnet server or client to listen to a specific VRF. This capability enables a Telnet server or client to look up the correct routing table and establish a connection.

**Syntax** `telnet {host | ip-address | ipv6-address prefix-length | vrf vrf instance name } [/source-interface]`

### Parameters

<b>host</b>	Enter the name of a server.
<b>ip-address</b>	Enter the IPv4 address in dotted decimal format of the server.
<b>ipv6-address prefix-length</b>	Enter the IPv6 address in the x:x:x:x::x format then the prefix length in the /x format. The range is from /0 to /128.
	 <b>NOTE:</b> The :: notation specifies successive hexadecimal fields of zeros.
<b>vrf instance</b>	(Optional) Enter the keyword <code>vrf</code> then the VRF instance name.
<b>source-interface</b>	(OPTIONAL) Enter the keywords <code>/source-interface</code> then the interface information to include the source interface. Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>• For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li> <li>• For a Null interface, enter the keyword <code>null</code> then the Null interface number.</li> <li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li> </ul>

- For Tunnel interface types, enter the keyword `tunnel` then the slot/ port information. The range is from 1 to 16383.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults** Not configured.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810. Added support for <i>source-interface</i> for link-local IPv6 addressing.
8.3.11.1	Introduced on the Z9000.
8.2.1.0	Introduced on the E-Series ExaScale (IPv6). Increased the number of VLANs on ExaScale to 4094 (was 2094).
8.1.1.0	Introduced on the E-Series ExaScale (IPv4).
7.9.1.0	Introduced VRF.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series and added support for IPv6 address on the E-Series only.

**Usage Information** The VRF configured using this command has a higher precedence than a VRF configured using the `ip telnet vrf vrf-name` command. If you do not use the VRF attribute in this command, then TELENT client uses the VRF configured using the `ip telnet vrf vrf-name` command.

The source interface configured using this command has a higher precedence than the source interface configured using the `ip telnet source-interface` command. If you do not configure a source interface using this command, then the TELNET client uses the source interface configured using the `ip telnet source-interface` command.

In case there is a mismatch between the VRF telnet source interface and the telnet VRF, then an error is reported.

**Example**            Dell#telnet vrf vrf1 10.10.10.2

## telnet-peer-stack-unit

Open a Telnet connection to the peer stack unit.

**Syntax**            telnet-peer-stack-unit

**Defaults**           Not configured.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**    This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.3.11.1	Introduced on the S-Series.

## terminal length

Configure the number of lines displayed on the terminal screen.

**Syntax**            terminal length *screen-length*

**Parameters**        *screen-length*     Enter a number of lines. Entering zero causes the terminal to display without pausing. The range is from 0 to 512.

<b>Defaults</b>	24 lines
<b>Command Modes</b>	<ul style="list-style-type: none"> <li>EXEC</li> <li>EXEC Privilege</li> </ul>
<b>Command History</b>	<p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p>

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

## traceroute

View a packet's path to a specific device.

**Syntax** `traceroute {host | vrf instance | ip-address | ipv6-address}`

<b>Parameters</b>	<i>host</i>	Enter the name of device.
	<i>ip-address</i>	Enter the IP address of the device in dotted decimal format.
	<i>ipv6-address</i>	Enter the IPv6 address, in the x:x:x:x format, to which you are testing connectivity.

**NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

<b>Defaults</b>	<ul style="list-style-type: none"> <li>Timeout = <b>5 seconds</b></li> <li>Probe count = <b>3</b></li> </ul>
-----------------	--

- 30 hops max
- 40 byte packet size
- UDP port = **33434**

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.2.1.0	Introduced on the E-Series ExaScale with IPv6.
8.1.1.0	Introduced on the E-Series ExaScale (IPv4 only).
7.9.1.0	Introduced VRF.
7.6.1.0	Added support for the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added support for IPv6 address on the E-Series.
E-Series	Original command.

**Usage Information**

When you enter the `traceroute` command without specifying an IP address (Extended Traceroute), you are prompted for a target and source IP address, timeout (in seconds) (default is **5**), a probe count (default is **3**), minimum TTL (default is **1**), maximum TTL (default is **30**), and port number (default is **33434**). To keep the default setting for those parameters, press the ENTER key.

For IPv6, you are prompted for a minimum hop count (default is **1**) and a maximum hop count (default is **64**).

**Example (IPv4)**

```
Dell#traceroute www.Dell Networking.com

Translating "www.Dell Networking.com"...domain server
(10.11.0.1) [OK]
Type Ctrl-C to abort.

-----
Tracing the route to www.Dell Networking.com (10.11.84.18),
30 hops max, 40 byte packets
```

```

-----
TTL Hostname      Probe1      Probe2      Probe3
1   10.11.199.190 001.000 ms 001.000 ms 002.000 ms
2   gwegress-sjc-02.Dell Networking.com (10.11.30.126) 005.000
ms 001.000 ms 001.000 ms
3   fw-sjc-01.Dell Networking.com (10.11.127.254) 000.000 ms
000.000 ms 000.000 ms
4   www.Dell Networking.com (10.11.84.18) 000.000 ms 000.000
ms 000.000 ms
FTOS#

```

### Example (IPv6)

```

Dell#traceroute 100::1

Type Ctrl-C to abort.

-----
Tracing the route to 100::1, 64 hops max, 60 byte packets
-----
Hops Hostname Probe1      Probe2      Probe3
1   100::1 000.000 ms 000.000 ms 000.000 ms

FTOS#traceroute 3ffe:501:ffff:100:201:e8ff:fe00:4c8b

Type Ctrl-C to abort.

-----
Tracing the route to 3ffe:501:ffff:100:201:e8ff:fe00:4c8b,
64 hops max, 60 byte packets
-----
Hops Hostname Probe1      Probe2      Probe3
1   3ffe:501:ffff:100:201:e8ff:fe00:4c8b
000.000 ms 000.000 ms 000.000 ms
Dell#

```

**Related Commands**      [ping](#) — tests the connectivity to a device.

## undebg all

Disable all debug operations on the system.

**Syntax**                    undebg all

**Defaults**                 none

**Command Modes**            EXEC Privilege

**Command History**         This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command

## virtual-ip

Configure a virtual IP address for the active management interface. You can configure virtual addresses both for IPv4 and IPv6 independently.

**Syntax** `virtual-ip {ipv4-address | ipv6-address}`  
 To return to the default, use the `no virtual-ip {ipv4-address | ipv6-address}` command.

**Parameters**

**ipv4-address** Enter the IP address of the active management interface in a dotted decimal format (A.B.C.D.).

**ipv6-address** Enter an IPv6 address of the active management interface, in the x:x:x:x::x format.

 **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

**Defaults** none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.

Version	Description
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

**Usage Information**

You can configure both IPv4 and IPv6 virtual addresses simultaneously, but only one of each. Each time this command is issued, it replaces the previously configured address of the same family, IPv4 or IPv6. The `no virtual-ip` command takes an address/prefix-length argument, so that the desired address only is removed. If you enter the `no virtual-ip` command without any specified address, then both IPv4 and IPv6 virtual addresses are removed.

**Related Commands**

[ip address](#) — assigns a primary and secondary IP address to the interface.

## write

Copy the current configuration to either the startup-configuration file or the terminal.

**Syntax**

```
write {memory compressed| terminal}
```

**Parameters**

<b>memory</b>	Enter the keyword <code>memory</code> to copy the current running configuration to the startup configuration file. This command is similar to the <code>copy running-config startup-config</code> command.
<b>compressed</b>	Enter the keyword <code>compressed</code> to write the operating configuration to the startup-config file in the compressed mode.
<b>terminal</b>	Enter the keyword <code>terminal</code> to copy the current running configuration to the terminal. This command is similar to the <code>show running-config</code> command.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
E-Series	Original command.

**Usage  
Information**

The `write memory` command saves the running-configuration to the file labeled startup-configuration. When using a LOCAL CONFIG FILE other than the startup-config not named "startup-configuration" (for example, you used a specific file during the `boot config` command), the running-config is not saved to that file; use the `copy` command to save any running-configuration changes to that local file.

**Related  
Commands**

[save](#) — saves configurations created in BOOT\_USER mode (BCLI).

# 802.1ag

802.1ag is available on the Dell Networking OS.

## ccm disable

Disable continuity check message (CCM).

**Syntax**                    `ccm disable`  
                               Enter `no ccm disable` to enable CCM.

**Defaults**                 Disabled

**Command Modes**         ECFM DOMAIN

**Command History**        This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the S-Series.

## ccm transmit-interval

Configure the transmit interval (mandatory). The interval specified applies to all maintenance endpoints (MEPs) in the domain.

**Syntax**                    `ccm transmit-interval seconds`

**Parameters**              *seconds*                    Enter a transmit interval. The intervals are 1, 10, 60, and 600.

<b>Defaults</b>	<b>10 seconds</b>
<b>Command Modes</b>	ECFM DOMAIN
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .  The following is a list of the Dell Networking OS version history for this command.

Version	Description
<b>Version 8.3.19.0</b>	Introduced on the S4820T.
<b>Version 8.3.11.1</b>	Introduced on the Z9000.
<b>Version 8.3.7.0</b>	Introduced on the S4810.
<b>Version 8.3.1.0</b>	Introduced on the S-Series.

## clear ethernet cfm traceroute-cache

Delete all link trace cache entries.

<b>Syntax</b>	<code>clear ethernet cfm traceroute-cache</code>
<b>Defaults</b>	none
<b>Command Modes</b>	ECFM DOMAIN
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .  The following is a list of the Dell Networking OS version history for this command.

Version	Description
<b>Version 8.3.19.0</b>	Introduced on the S4820T.
<b>Version 8.3.7.0</b>	Introduced on the S4810.
<b>Version 8.3.1.0</b>	Introduced on the S-Series.

## database hold-time

Set the amount of time that data from a missing MEP is kept in the continuity check database.

**Syntax** `database hold-time minutes`

**Parameters** *minutes* Enter a hold-time. The range is from 100 to 65535 minutes.

**Defaults** **100 minutes**

**Command Modes** ECFM DOMAIN

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the S-Series.

## disable

Disable Ethernet CFM without stopping the CFM process.

**Syntax** `disable`

**Defaults** Disabled

**Command Modes** ETHERNET CFM

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.

Version	Description
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the S-Series.

## domain

Create the maintenance domain.

**Syntax** `domain name md-level number`

**Parameters**

<b><i>name</i></b>	Name the maintenance domain.
<b>md-level <i>number</i></b>	Enter a maintenance domain level. The range is from 0 to 7.

**Defaults** none

**Command Modes** ETHERNET CFM

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the S-Series.

## ethernet cfm

Spawn the CFM process. No CFM configuration is allowed until the CFM process is spawned.

**Syntax** `ethernet cfm`

**Defaults** Disabled

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the S-Series.

## ethernet cfm mep

Create an MEP.

**Syntax**

```
ethernet cfm mep {up-mep | down-mep} domain {name | level} ma-name name mepid mep-id
```

**Parameters**

<b>[up-mep   down-mep]</b>	Specify whether the MEP is up or down facing. <ul style="list-style-type: none"><li>Up-MEP: monitors the forwarding path internal to a bridge on the customer or provider edge; on Dell Networking systems, the internal forwarding path is effectively the switch fabric and forwarding engine.</li><li>Down-MEP: monitors the forwarding path external to another bridge.</li></ul>
<b>domain [name   level]</b>	Enter the keyword <code>domain</code> and then enter the domain name or domain level.
<b>ma-name name</b>	Enter the keyword <code>ma-name</code> and then enter the name of the maintenance association.
<b>mepid mep-id</b>	Enter an MEP ID. The range is from 1 to 8191.

**Defaults**

none

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the S-Series.

## ethernet cfm mip

Create a maintenance intermediate point (MIP).

**Syntax** `ethernet cfm mip domain {name | level} ma-name name`

**Parameters**

<b>domain</b> [ <i>name</i>   <i>level</i> ]	Enter the keyword <code>domain</code> then the domain name or domain level.
<b>ma-name</b> <i>name</i>	Enter the keyword <code>ma-name</code> then the name of the maintenance association.

**Defaults** none

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the S-Series.

## mep cross-check

Enable cross-checking for a MEP.

**Syntax** `mep cross-check mep-id`

**Parameters**

<i>mep-id</i>	Enter the MEP ID. The range is from 1 to 8191.
---------------	--

**Defaults** none

**Command Modes** ECFM DOMAIN

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the S-Series.

## mep cross-check enable

Enable cross-checking.

**Syntax** `mep cross-check enable {port | vlan-id}`

**Parameters**

<i>port</i>	Down service with no VLAN association.
<i>vlan-id</i>	Enter the VLAN to apply the cross-check.

**Defaults** none

**Command Modes** ECFM DOMAIN

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the S-Series.

## mep cross-check start-delay

Configure the amount of time the system waits for a remote MEP to come up before the cross-check operation is started.

**Syntax** `mep cross-check start-delay number`

**Parameters**

<b>start-delay <i>number</i></b>	Enter a start-delay in seconds. The range is from 3 to 100 seconds.
----------------------------------	---

**Defaults** `3 ccms`

**Command Modes** ETHERNET CFM

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the S-Series.

## ping ethernet

Send a loopback message.

**Syntax** `ping ethernet domain [name l level] ma-name ma-name remote {dest-mep-id | mac-addr mac-address} source {src-mep-id | port interface}`

**Parameters**

<i>name   level</i>	Enter the domain name or level.
<i>ma-name ma-name</i>	Enter the keyword <code>ma-name</code> and then enter the maintenance association name.
<i>dest-mep-id</i>	Enter the MEP ID that is the target of the ping.
<i>mac-addr mac-address</i>	Enter the keyword <code>mac-addr</code> and then enter the MAC address that is the target of the ping.
<i>src-mep-id</i>	Enter the MEP ID that originates the ping.
<i>port interface</i>	Enter the keyword <code>port</code> and then enter the interface that originates the ping.

**Defaults**

none

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the S-Series.

## show ethernet cfm domain

Display maintenance domain information.

**Syntax**

```
show ethernet cfm domain [name | level | brief]
```

**Parameters**

<i>name   level</i>	Enter the maintenance domain name or level.
<i>brief</i>	Enter the keyword <code>brief</code> to display a summary output.

**Defaults**

none

**Command Modes**

EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the S-Series.

## Example

```
Dell# show ethernet cfm domain
Domain Name: customer
Level: 7
Total Service: 1
  Services
    MA-Name      VLAN      CC-Int      X-CHK Status
    My_MA        200       10s         enabled
Domain Name: My_Domain
Level: 6
Total Service: 1
  Services
    MA-Name      VLAN      CC-Int      X-CHK Status
    Your_MA      100       10s         enabled
```

# show ethernet cfm maintenance-points local

Display configured MEPs and MIPs.

**Syntax** `show ethernet cfm maintenance-points local [mep | mip]`

## Parameters

**mep** Enter the keyword `mep` to display configured MEPs.

**mip** Enter the keyword `mip` to display configured MIPs.

**Defaults** none

**Command Modes** EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
Version 8.3.19.0	Introduced on the S4820T.

Version	Description
Version 8.3.7.0	Introduced on the S4810.
Version 8.3.1.0	Introduced on the S-Series.

**Example**

```
Dell#show ethernet cfm maintenance-points local mip
```

```
-----
MPID Domain Name Level  Type Port CCM-Status
      MA Name      VLAN  Dir  MAC
-----
0 servicel      4      MIP Te 1/5   Disabled
  My_MA         3333   DOWN 00:01:e8:0b:c6:36

0 servicel      4      MIP Te 1/5   Disabled
  Your_MA      3333   UP   00:01:e8:0b:c6:36

-----
MPID Domain Name Level  Type Port CCM-Status
      MA Name      VLAN  Dir  MAC
-----
0 servicel      4      MIP Te 1/5/1  Disabled
  My_MA         3333   DOWN 00:01:e8:0b:c6:36

0 servicel      4      MIP Te 1/5/1  Disabled
  Your_MA      3333   UP   00:01:e8:0b:c6:36
```

## show ethernet cfm maintenance-points remote

Display the MEP Database.

**Syntax** `show ethernet cfm maintenance-points remote detail [active | domain {level | name} | expired | waiting]`

Parameters	
<b>active</b>	Enter the keyword <code>active</code> to display only the MEPs in active state.
<b>domain [name   level]</b>	Enter the keyword <code>domain</code> then the domain name or domain level.
<b>expired</b>	Enter the keyword <code>expired</code> to view MEP entries that have expired due to connectivity failure.
<b>waiting</b>	Enter the keyword <code>waiting</code> to display MEP entries waiting for response.

**Defaults** none

**Command Modes** EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
Version 8.3.19.0	Introduced on the S4820T.
Version 8.3.7.0	Introduced on the S4810.
Version 8.3.1.0	Introduced on the S-Series.

**Example**

```
Dell#show ethernet cfm maintenance-points remote detail
MAC Address: 00:01:e8:58:68:78
Domain Name: cfm0
MA Name: test0
Level: 7
VLAN: 10
MP ID: 900
Sender Chassis ID: Force10
MEP Interface status: Up
MEP Port status: Forwarding
Receive RDI: FALSE
MP Status: Active
```

## show ethernet cfm mipbd

Display the MIP database.

<b>Syntax</b>	show ethernet cfm mipdb
<b>Defaults</b>	none
<b>Command Modes</b>	EXEC Privilege
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the S-Series.

## show ethernet cfm statistics

Display MEP statistics.

<b>Syntax</b>	<code>show ethernet cfm statistics [domain {<i>name</i>   <i>level</i>} vlan-id vlan-id mpid mpid]</code>								
<b>Parameters</b>	<table><tr><td><b>domain</b></td><td>Enter the keyword <code>domain</code> to display statistics for a particular domain.</td></tr><tr><td><b><i>name</i>   <i>level</i></b></td><td>Enter the domain name or level.</td></tr><tr><td><b>vlan-id <i>vlan-id</i></b></td><td>Enter the keyword <code>vlan-id</code> then a VLAN ID.</td></tr><tr><td><b>mpid <i>mpid</i></b></td><td>Enter the keyword <code>mpid</code> then a maintenance point ID.</td></tr></table>	<b>domain</b>	Enter the keyword <code>domain</code> to display statistics for a particular domain.	<b><i>name</i>   <i>level</i></b>	Enter the domain name or level.	<b>vlan-id <i>vlan-id</i></b>	Enter the keyword <code>vlan-id</code> then a VLAN ID.	<b>mpid <i>mpid</i></b>	Enter the keyword <code>mpid</code> then a maintenance point ID.
<b>domain</b>	Enter the keyword <code>domain</code> to display statistics for a particular domain.								
<b><i>name</i>   <i>level</i></b>	Enter the domain name or level.								
<b>vlan-id <i>vlan-id</i></b>	Enter the keyword <code>vlan-id</code> then a VLAN ID.								
<b>mpid <i>mpid</i></b>	Enter the keyword <code>mpid</code> then a maintenance point ID.								
<b>Defaults</b>	none								
<b>Command Modes</b>	EXEC Privilege								
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .								

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the S-Series.

<b>Example</b>	<pre>Dell# show ethernet cfm statistics Domain Name: Customer Domain Level: 7 MA Name: My_MA MPID: 300  CCMs:   Transmitted:          1503   RcvdSeqErrors: 0 LTRs:   Unexpected Rcvd:      0 LBRs:   Received:             0       Rcvd Out Of Order: 0   Received Bad MSDU:    0   Transmitted:          0</pre>
----------------	--

## show ethernet cfm port-statistics

Display CFM statistics by port.

**Syntax** `show ethernet cfm port-statistics [interface type slot/port[]]`

**Parameters**

<b>interface type</b>	Enter the keyword <code>interface</code> then the interface type.
<b>slot/port[]</b>	Enter the slot and port numbers for the port.

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the S-Series.

**Example**

## show ethernet cfm traceroute-cache

Display the link trace cache.

**Syntax** `show ethernet cfm traceroute-cache`

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
Version 8.3.19.0	Introduced on the S4820T.

Version	Description
Version 8.3.7.0	Introduced on the S4810.
Version 8.3.1.0	Introduced on the S-Series.

**Example**

```
Dell#show ethernet cfm traceroute-cache

Traceroute to 00:01:e8:52:4a:f8 on Domain Customer2, Level 7,
MA name Test2 with VLAN
2
-----
Hops      Host                IngressMAC          Ingr Action
Relay Action
      Next Host                Egress MAC          Egress Action
FWD Status
-----
4  00:00:00:01:e8:53:4a:f8  00:01:e8:52:4a:f8  IngOK
RlyHit
      00:00:00:01:e8:52:4a:f8
Terminal MEP
```

## service

Create maintenance association.

**Syntax** `service name vlan vlan-id`

**Parameters**

- name** Enter a maintenance association name.
- vlan vlan-id** Enter the keyword `vlan` and then enter the VLAN ID. The range is from 1 to 4094.

**Defaults** none

**Command Modes** ECFM DOMAIN

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the S-Series.

## traceroute cache hold-time

Set the amount of time a trace result is cached.

**Syntax** `traceroute cache hold-time minutes`

**Parameters** *minutes* Enter a hold-time. The range is from 10 to 65535 minutes.

**Defaults** **100 minutes**

**Command Modes** ETHERNET CFM

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the S-Series.

## traceroute cache size

Set the size of the link trace cache.

**Syntax** `traceroute cache size entries`

**Parameters** *entries* Enter the number of entries the link trace cache can hold. The range is from 1 to 4095 entries.

**Defaults** **100 entries**

**Command Modes** ETHERNET CFM

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the S-Series.

## traceroute ethernet

Send a linktrace message to an MEP.

**Syntax** `traceroute ethernet domain [name | level] ma-name remote {mep-id mep-id | mac-addr mac-address}`

**Parameters**

<b>domain</b> <i>name</i>   <i>level</i>	Enter the keyword <code>domain</code> then the domain name or level.
<b>ma-name</b> <i>ma-name</i>	Enter the keyword <code>ma-name</code> then the maintenance association name.
<b>mepid</b> <i>mep-id</i>	Enter the MEP ID that is the trace target.
<b>mac-addr</b> <i>mac-address</i>	Enter the MAC address of the trace target.

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the S-Series.

## 802.1X

An authentication server must authenticate a client connected to an 802.1X switch port. Until the authentication, only extensible authentication protocol over LAN (EAPOL) traffic is allowed through the port to which a client is connected. After authentication is successful, normal traffic passes through the port.

The Dell Networking operating software supports remote authentication dial-in service (RADIUS) and active directory environments using 802.1X Port Authentication.

### Important Points to Remember

Dell Networking operating software limits network access for certain users by using virtual local area network (VLAN) assignments. 802.1X with VLAN assignment has these characteristics when configured on the switch and the RADIUS server.

- If the primary RADIUS server becomes unresponsive, the authenticator begins using a secondary RADIUS server, if configured.
- If no VLAN is supplied by the RADIUS server or if you disable 802.1X authorization, the port configures in its access VLAN after successful authentication.
- If you enable 802.1X authorization but the VLAN information from the RADIUS server is not valid, the port returns to the Unauthorized state and remains in the configured access VLAN. This safeguard prevents ports from appearing unexpectedly in an inappropriate VLAN due to a configuration error. Configuration errors create an entry in Syslog.
- If you enable 802.1X authorization and all information from the RADIUS server is valid, the port is placed in the specified VLAN after authentication.
- If you enable port security on an 802.1X port with VLAN assignment, the port is placed in the RADIUS server assigned VLAN.
- If you disable 802.1X on the port, it returns to the configured access VLAN.
- When the port is in the Force Authorized, Force Unauthorized, or Shutdown state, it is placed in the configured access VLAN.
- If an 802.1X port is authenticated and put in the RADIUS server assigned VLAN, any change to the port access VLAN configuration does not take effect.
- The 802.1X with VLAN assignment feature is not supported on trunk ports, dynamic ports, or with dynamic-access port assignment through a VLAN membership.

## debug dot1x

Display 802.1X debugging information.

**Syntax** `debug dot1x [all | auth-pae-fsm | backend-fsm | eapol-pdu]  
[interface interface]`

**Parameters**

<b>all</b>	Enable all 802.1X debug messages.
<b>auth-pae-fsm</b>	Enable authentication PAE FSM debug messages.
<b>backend-fsm</b>	Enable backend FSM debug messages.
<b>eapol-pdu</b>	Enable the EAPOL frame trace and related debug messages.
<b>interface <i>interface</i></b>	Restricts the debugging information to an interface.

**Defaults** Disabled

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.4.1.0	Introduced on the C-Series and S-Series.

## dot1x auth-fail-vlan

Configure an authentication failure VLAN for users and devices that fail 802.1X authentication.

**Syntax** `dot1x auth-fail-vlan vlan-id [max-attempts number]  
To delete the authentication failure VLAN, use the no dot1x auth-fail-vlan  
vlan-id [max-attempts number] command.`

<b>Parameters</b>	<b><i>vlan-id</i></b>	Enter the VLAN Identifier. The range is from 1 to 4094.
	<b><i>max-attempts number</i></b>	(OPTIONAL) Enter the keywords <code>max-attempts</code> followed number of attempts desired before authentication fails. The range is from 1 to 5. The default is <b>3</b> .

**Defaults**            **3** attempts

**Command Modes**        CONFIGURATION (*conf-if-interface-slot/port*)

**Command History**        This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

<b>Version</b>	<b>Description</b>
<b>9.7(0.0)</b>	Introduced on the S6000–ON.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>9.0.0.0</b>	Introduced on the Z9000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.12.0</b>	Introduced on the S4810.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.4.1.0</b>	Introduced on the C-Series and S-Series.

**Usage Information**        If the host responds to 802.1X with an incorrect login/password, the login fails. The switch attempts to authenticate again until the maximum attempts configured is reached. If the authentication fails after all allowed attempts, the interface moves to the authentication failed VLAN.

After the authentication VLAN is assigned, the port-state must be toggled to restart authentication. Authentication occurs at the next reauthentication interval (`dot1x reauthentication`).

- Related Commands**
- [dot1x port-control](#) — Enable port control on an interface
  - [dot1x guest-vlan](#) — Configure a guest VLAN for limited access users or for devices that are not 802.1X capable.
  - [show dot1x interface](#) — Display the 802.1X configuration of an interface.

## dot1x auth-server

Configure the authentication server to RADIUS.

**Syntax** `dot1x auth-server radius`

**Defaults** none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.6.1.0	Introduced on the C-Series and S-Series.
7.4.1.0	Introduced on the E-Series.

## dot1x auth-type mab-only

To authenticate a device with MAC authentication bypass (MAB), only use the host MAC address.

**Syntax** `dot1x auth-type mab-only`

**Defaults** Disabled

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.4.2.1	Introduced on the C-Series and S-Series.

### Usage Information

The prerequisites for enabling MAB-only authentication on a port are:

- Enable 802.1X authentication globally on the switch and on the port (the `dot1x authentication` command).
- Enable MAC authentication bypass on the port (the `dot1x mac-auth-bypass` command).

In MAB-only authentication mode, a port authenticates using the host MAC address even though 802.1x authentication is enabled. If the MAB-only authentication fails, the host is placed in the guest VLAN (if configured).

To disable MAB-only authentication on a port, enter the `no dot1x auth-type mab-only` command.

### Related Commands

[dot1x mac-auth-bypass](#) — Enable MAC authentication bypass.

## dot1x authentication (Configuration)

Enable dot1x globally. Enable dot1x both globally and at the interface level.

### Syntax

`dot1x authentication`

To disable dot1x on a globally, use the `no dot1x authentication` command.

### Defaults

Disabled

### Command Modes

CONFIGURATION

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.6.1.0	Introduced on the C-Series and S-Series.
7.4.1.0	Introduced on the E-Series TeraScale.

**Related Commands** [dot1x authentication \(Interface\)](#) — Enables dot1x on an interface.

## dot1x authentication (Interface)

Enable dot1x on an interface. Enable dot1x both globally and at the interface level.

**Syntax** `dot1x authentication`  
To disable dot1x on an interface, use the `no dot1x authentication` command.

**Defaults** Disabled

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.6.1.0	Introduced on the C-Series and S-Series.

Version	Description
7.4.1.0	Introduced on the E-Series.

**Related Commands** [dot1x authentication \(Configuration\)](#) — Enables dot1x globally.

## dot1x guest-vlan

Configure a guest VLAN for limited access users or for devices that are not 802.1X capable.

**Syntax** `dot1x guest-vlan vlan-id`  
 To disable the guest VLAN, use the `no dot1x guest-vlan vlan-id` command.

**Parameters** **vlan-id** Enter the VLAN Identifier. The range is from 1 to 4094.

**Defaults** Not configured.

**Command Modes** CONFIGURATION (*conf-if-interface-slot/port*)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.6.1.0	Introduced on the C-Series, E-Series, and S-Series.

**Usage Information** 1X authentication is enabled when an interface is connected to the switch. If the host fails to respond within a designated amount of time, the authenticator places the port in the guest VLAN.

If a device does not respond within 30 seconds, it is assumed that the device is not 802.1X capable. Therefore, a guest VLAN is allocated to the interface and authentication, for the device, occurs at the next reauthentication interval (`dot1x reauthentication`).

If the host fails authentication for the designated number of times, the authenticator places the port in authentication failed VLAN (`dot1x auth-fail-vlan`).

**NOTE:** You can create the Layer 3 portion of a guest VLAN and authentication fail VLANs regardless if the VLAN is assigned to an interface or not. After an interface is assigned a guest VLAN (which has an IP address), routing through the guest VLAN is the same as any other traffic. However, the interface may join/leave a VLAN dynamically.

#### Related Commands

- [dot1x auth-fail-vlan](#) — Configure an authentication failure VLAN.
- [dot1x reauthentication](#) — Enable periodic re-authentication of the client.
- [dot1x reauth-max](#) — Configure the maximum number of times to re-authenticate a port before it becomes unauthorized

## dot1x host-mode

Enable single-host or multi-host authentication.

**Syntax** `dot1x host-mode {single-host | multi-host | multi-auth}`

**Parameters**

<b>single-host</b>	Enable single-host authentication.
<b>multi-host</b>	Enable multi-host authentication.
<b>multi-auth</b>	Enable multi-suplicant authentication.

**Defaults** **single-host**

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

Version	Description
8.3.11.1	Introduced on the Z9000.
8.4.1.0	Added the <code>multi-auth</code> option on the C-Series and S-Series.
8.3.2.0	Added the <code>single-host</code> and <code>multi-host</code> options on the C-Series, E-Series, and S-Series.

#### Usage Information

- Single-host mode authenticates only one host per authenticator port and drops all other traffic on the port.
- Multi-host mode authenticates the first host to respond to an Identity Request and then permits all other traffic on the port.
- Multi-supplicant mode authenticates every device attempting to connect to the network on the authenticator port.

#### Related Commands

[show dot1x interface](#) — Display the 802.1X configuration of an interface.

## dot1x mac-auth-bypass

Enable MAC authentication bypass. If 802.1X times out because the host did not respond to the Identity Request frame, Dell Networking OS attempts to authenticate the host based on its MAC address.

#### Syntax

```
dot1x mac-auth-bypass
```

To disable MAC authentication bypass on a port, use the `no dot1x mac-auth-bypass` command.

#### Defaults

Disabled

#### Command Modes

INTERFACE

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

Version	Description
8.3.11.1	Introduced on the Z9000.
8.4.1.0	Introduced on the C-Series and S-Series.

**Usage Information** To disable MAC authentication bypass on a port, enter the `no dot1x mac-auth-bypass` command.

## dot1x max-eap-req

Configure the maximum number of times an extensive authentication protocol (EAP) request is transmitted before the session times out.

**Syntax** `dot1x max-eap-req number`  
To return to the default, use the `no dot1x max-eap-req` command.

**Parameters** *number* Enter the number of times an EAP request is transmitted before a session time-out. The range is from 1 to 10. The default is **2**.

**Defaults** **2**

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.6.1.0	Introduced on the C-Series and S-Series.
7.4.1.0	Introduced on the E-Series.

## dot1x max-suplicants

Restrict the number of supplicants that can be authenticated and permitted to access the network through the port. This configuration is only takes effect in Multi-auth mode.

**Syntax** `dot1x max-suplicants number`

**Parameters** *number* Enter the number of supplicants that can be authenticated on a single port in Multi-auth mode. The range is from 1 to 128. The default is **128**.

**Defaults** 128 hosts can be authenticated on a single authenticator port.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.4.1.0	Introduced on the C-Series and S-Series.

**Related Commands** [dot1x host-mode](#) — Enables single-host or multi-host authentication.

## dot1x port-control

Enable port control on an interface.

**Syntax** `dot1x port-control {force-authorized | auto | force-unauthorized}`

**Parameters** **force-authorized** Enter the keywords `force-authorized` to forcibly authorize a port.

	<b>auto</b>	Enter the keyword <code>auto</code> to authorize a port based on the 802.1X operation result.
	<b>force-unauthorized</b>	Enter the keywords <code>force-unauthorized</code> to forcibly deauthorize a port.
<b>Defaults</b>	none	
<b>Command Modes</b>	Auto	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .	
	The following is a list of the Dell Networking OS version history for this command.	
	<b>Version</b>	<b>Description</b>
	9.7(0.0)	Introduced on the S6000-ON.
	9.0.2.0	Introduced on the S6000.
	9.0.0.0	Introduced on the Z9000.
	8.3.19.0	Introduced on the S4820T.
	8.3.12.0	Introduced on the S4810.
	8.3.11.1	Introduced on the Z9000.
	7.6.1.0	Introduced on the C-Series and S-Series.
	7.4.1.0	Introduced on the E-Series.
<b>Usage Information</b>	The authenticator completes authentication only when you set <code>port-control</code> to <code>auto</code> .	

## dot1x quiet-period

Set the number of seconds that the authenticator remains quiet after a failed authentication with a client.

**Syntax** `dot1x quiet-period seconds`  
 To disable quiet time, use the `no dot1x quiet-time` command.

**Parameters** `seconds` Enter the number of seconds. The range is from 1 to 65535. The default is **60**.

**Defaults** **60** seconds

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
7.6.1.0	Introduced on the C-Series and S-Series.
7.4.1.0	Introduced on the E-Series.

## dot1x reauthentication

Enable periodic reauthentication of the client.

**Syntax** `dot1x reauthentication [interval seconds]`  
To disable periodic reauthentication, use the `no dot1x reauthentication` command.

**Parameters**

<b>interval seconds</b>	(Optional) Enter the keyword <code>interval</code> then the interval time, in seconds, after which reauthentication is initiated. The range is from 1 to 31536000 (one year). The default is <b>3600</b> (1 hour).
-------------------------	--

**Defaults** **3600** seconds (1 hour)

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.6.1.0	Introduced on the C-Series and S-Series.
7.4.1.0	Introduced on the E-Series.

## dot1x reauth-max

Configure the maximum number of times a port can re-authenticate before the port becomes unauthorized.

### Syntax

```
dot1x reauth-max number
```

To return to the default, use the `no dot1x reauth-max` command.

### Parameters

*number*

Enter the permitted number of re-authentications. The range is from 1 to 10. The default is **2**.

### Defaults

**2**

### Command Modes

INTERFACE

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.

Version	Description
7.6.1.0	Introduced on the C-Series and S-Series.
7.4.1.0	Introduced on the E-Series.

## dot1x server-timeout

Configure the amount of time after which exchanges with the server time-out.

**Syntax** `dot1x server-timeout seconds`  
To return to the default, use the `no dot1x server-timeout` command.

**Parameters**

**seconds** Enter a time-out value in seconds. The range is from 1 to 300, where 300 is implementation dependant. The default is **30**.

**Defaults** **30** seconds

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.6.1.0	Introduced on the C-Series and S-Series.
7.4.1.0	Introduced on the E-Series.

**Usage Information** When you configure the `dot1x server-timeout` value, take into account the communication medium used to communicate with an authentication server and the number of RADIUS servers configured. Ideally, the `dot1x server-timeout` value (in seconds) is based on the configured RADIUS-server timeout and retransmit values and calculated according to the following formula: `dot1x`

`server-timeout seconds > (radius-server retransmit seconds + 1) * radius-server timeout seconds.`

Where the default values are as follows: `dot1x server-timeout` (30 seconds), `radius-server retransmit` (3 seconds), and `radius-server timeout` (5 seconds).

#### Example

```
Dell(conf)#radius-server host 10.11.197.105 timeout 6
Dell(conf)#radius-server host 10.11.197.105 retransmit 4
Dell(conf)#interface tengigabitethernet 2/23
Dell(conf-if-te-2/23)#dot1x server-timeout 40
```

## dot1x supplicant-timeout

Configure the amount of time after which exchanges with the supplicant time-out.

#### Syntax

`dot1x supplicant-timeout seconds`

To return to the default, use the `no dot1x supplicant-timeout` command.

#### Parameters

##### seconds

Enter a time-out value in seconds. The range is from 1 to 300, where 300 is implementation dependant. The default is **30**.

#### Defaults

**30** seconds

#### Command Modes

INTERFACE

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.6.1.0	Introduced on the C-Series and S-Series.
7.4.1.0	Introduced on the E-Series.

## dot1x tx-period

Configure the intervals at which EAPOL PDUs the Authenticator PAE transmits.

**Syntax** `dot1x tx-period seconds`  
To return to the default, use the `no dot1x tx-period` command.

**Parameters** **seconds** Enter the interval time, in seconds, that EAPOL PDUs are transmitted. The range is from 1 to 65535. The default is **30**.

**Defaults** **30** seconds

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
7.6.1.0	Introduced on the C-Series and S-Series.
7.4.1.0	Introduced on the E-Series.

## show dot1x cos-mapping interface

Display the CoS priority-mapping table the RADIUS server provides and applies to authenticated supplicants on an 802.1X-enabled system.

**Syntax** `show dot1x cos-mapping interface interface [mac-address mac-address]`

**Parameters** **interface** Enter one of the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**mac-address** (Optional) MAC address of an 802.1X-authenticated supplicant.

**Defaults** none

- Command Modes**
- EXEC
  - EXEC privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.4.2.1	Introduced on the C-Series and S-Series.

**Usage Information** Enter a supplicant's MAC address using the `mac-address` option to display CoS mapping information only for the specified supplicant.

You can display the CoS mapping information applied to traffic from authenticated supplicants on 802.1X-enabled ports that are in Single-Hot, Multi-Host, and Multi-Supplicant authentication modes.

**Example**

```
Dell#show dot1x cos-mapping interface tengigabitethernet 1/32
802.1p CoS re-map table on Te 1/32:
-----
Dot1p      Remapped Dot1p
0          7
1          6
2          5
3          4
4          3
5          2
6          1
7          0
Dell#
```

```

Dell#show dot1x cos-mapping interface tengigabitethernet 1/32
mac-address 00:00:00:00:00:10
Supplicant Mac: 0 0 0 0 0 10 Lookup for Mac:

802.1p CoS re-map table on Te 0/32:
-----

802.1p CoS re-map table for Supplicant: 00:00:00:00:00:10

Dot1p          Remapped Dot1p
0              7
1              6
2              5
3              4
4              3

6              1
7              0
Dell#

```

## show dot1x interface

Display the 802.1X configuration of an interface.

<b>Syntax</b>	<code>show dot1x interface <i>interface</i> [mac-address <i>mac-address</i>]</code>	
<b>Parameters</b>	<b><i>interface</i></b>	<p>Enter one of the following keywords and slot/port or number information:</p> <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> </ul>
	<b><i>mac-address</i></b>	(Optional) MAC address of a supplicant.
<b>Defaults</b>	none	
<b>Command Modes</b>	<ul style="list-style-type: none"> <li>• EXEC</li> <li>• EXEC privilege</li> </ul>	
<b>Command History</b>	<p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p>	

Version	Description
9.7(0.0)	Introduced on the S6000-ON.

Version	Description
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.4.2.1	Added the <code>mac-address</code> option on the C-Series and S-Series.
7.6.1.0	Introduced on the C-Series, E-Series, and S-Series.

### Usage Information

If you enable 802.1X multi-supplicant authentication on a port, additional 802.1X configuration details (Port Authentication status, Untagged VLAN ID, Authentication PAE state, and Backend state) display for each supplicant, as shown in the following example.

### Example

```
Dell#show dot1x interface tengigabitethernet 1/32
802.1x information on Te 1/32:
-----
Dot1x Status:          Enable
Port Control:          AUTO
Port Auth Status:      AUTHORIZED (MAC-AUTH-BYPASS)
Re-Authentication:     Disable
Untagged VLAN id:     400
Guest VLAN:            Enable
Guest VLAN id:        100
Auth-Fail VLAN:        Disable
Auth-Fail VLAN id:    NONE
Auth-Fail Max-Attempts: NONE
Mac-Auth-Bypass:       Enable
Mac-Auth-Bypass Only: Enable
Tx Period:              3 seconds
Quiet Period:          60 seconds
ReAuth Max:            2
Supplicant Timeout:    30 seconds
Server Timeout:        30 seconds
Re-Auth Interval:      3600 seconds
Max-EAP-Req:           2
Host Mode:              SINGLE_HOST
Auth PAE State:         Authenticated
Backend State:         Idle
Dell#
```

### Example (mac-address)

```
Dell#show dot1x interface tengigabitethernet 1/32 mac-address
00:00:00:00:00:10
Supplicant Mac: 0 0 0 0 0 10 Lookup for Mac:

802.1x information on Te 1/32:
-----
Dot1x Status:          Enable
Port Control:          AUTO
Re-Authentication:     Disable
Guest VLAN:            Enable
```

```
Guest VLAN id:          100
Auth-Fail VLAN:        Disable
Auth-Fail VLAN id:     NONE
Auth-Fail Max-Attempts: NONE

## Access Control Lists (ACL)

Access control lists (ACLs) are supported by the Dell Networking OS.

Dell Networking OS supports the following types of ACL, IP prefix list, and route maps:

- Commands Common to all ACL Types
- Common IP ACL Commands
- Standard IP ACL Commands
- Extended IP ACL Commands
- Common MAC Access List Commands
- Standard MAC ACL Commands
- Extended MAC ACL Commands
- IP Prefix List Commands
- Route Map Commands
- AS-Path Commands
- IP Community List Commands

 **NOTE:** For ACL commands that use the Trace function, refer to the Trace List Commands section in the [Security](#) chapter.

 **NOTE:** For IPv6 ACL commands, refer to [IPv6 Access Control Lists \(IPv6 ACLs\)](#).

### Commands Common to all ACL Types

The following commands are available within each ACL mode and do not have mode-specific options. Some commands in this chapter may use similar names, but require different options to support the different ACL types (for example, the `deny` and `permit` commands).

#### remark

Enter a description for an ACL entry.

**Syntax**                    `remark [remark-number] [description]`

**Parameters**

<b><i>remark-number</i></b>	Enter the remark number. The range is from 0 to 4294967290.
-----------------------------	---

**NOTE:** You can use the same sequence number for the remark and an ACL rule.

**description** Enter a description of up to 80 characters.

**Defaults**

Not configured.

**Command Modes**

- CONFIGURATION-STANDARD-ACCESS-LIST
- CONFIGURATION-EXTENDED-ACCESS-LIST
- CONFIGURATION-MAC ACCESS LIST-STANDARD
- CONFIGURATION-MAC ACCESS LIST-EXTENDED

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.4.1.0	Introduced on the E-Series.

**Usage Information**

The `remark` command is available in each ACL mode. You can configure up to 4294967290 remarks in a given ACL.

The following example shows the use of the `remark` command twice within CONFIGURATION-STANDARD-ACCESS-LIST mode. The same sequence number was used for the remark and for an associated ACL rule. The remark precedes the rule in the running-config because it is assumed that the remark is for the rule with the same sequence number, or the group of rules that follow the remark.

**Example**

```
Dell(config-std-nacl)#remark 10 Deny rest of the traffic
Dell(config-std-nacl)#remark 5 Permit traffic from XYZ Inc.
Dell(config-std-nacl)#show config
!
ip access-list standard test
remark 5 Permit traffic from XYZ Inc.
seq 5 permit 1.1.1.0/24
remark 10 Deny rest of the traffic
seq 10 Deny any
Dell(config-std-nacl)#
```

**Related  
Commands**

[show config](#) — displays the current ACL configuration.

## show config

Display the current ACL configuration.

**Syntax**

```
show config
```

**Command  
Modes**

- CONFIGURATION-STANDARD-ACCESS-LIST
- CONFIGURATION-EXTENDED-ACCESS-LIST
- CONFIGURATION-MAC ACCESS LIST-STANDARD
- CONFIGURATION-MAC ACCESS LIST-EXTENDED

**Command  
History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.11.1	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.2.1.1	Introduced on the E-Series.

**Example**

```
Dell(config-std-nacl)#show conf
!
ip access-list standard test
 remark 5 Permit traffic from XYZ Inc.
 seq 5 permit 1.1.1.0/24 count
 remark 10 Deny traffic from ABC
 seq 10 deny 2.1.1.0/24 count
Dell(config-std-nacl)#
```

# Common IP ACL Commands

The following commands are available within both Ingress and Egress IP ACL modes (Standard and Extended) and do not have mode-specific options. When an ACL is created without a rule and then is applied to an interface, ACL behavior reflects an implicit permit.

The platform supports both Ingress and Egress IP ACLs.

 **NOTE:** Also refer to the [Commands Common to all ACL Types](#) section.

## access-class

Apply a standard ACL to a terminal line.

**Syntax** `access-class access-list-name [ipv4 | ipv6]`  
To remove an ACL, use the `no access-class access-list-name [ipv4 | ipv6]` command.

**Parameters**

<b>access-list-name</b>	Enter the name of a configured Standard ACL, up to 140 characters.
<b>ipv4</b>	Enter the keyword <code>ipv4</code> to configure an IPv4 access class.
<b>ipv6</b>	Enter the keyword <code>ipv6</code> to configure an IPv6 access class.

**Defaults** Not configured.

**Command Modes** LINE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.8(0.0)	Added the <code>ipv4</code> and <code>ipv6</code> parameters to the command. Introduced on the S3048-ON and S4048-ON.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.8.1.0	Increase the name string to accept up to 140 characters. Prior to 7.8.1.0, names were up to 16 characters long.

Version	Description
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.2.1.1	Introduced on the E-Series.

### Usage Information

When you use the `access-class access-list-name` command without specifying the `ipv4` or `ipv6` attribute, both IPv4 as well as IPv6 rules that are defined in that ACL are applied to the terminal. This method is a generic way of configuring access restrictions.

To be able to filter access exclusively using either IPv4 or IPv6 rules, use either the `ipv4` or `ipv6` attribute along with the `access-class access-list-name` command. Depending on the attribute that you specify (`ipv4` or `ipv6`), the ACL processes either IPv4 or IPv6 rules, but not both. Using this configuration, you can set up two different types of access classes with each class processing either IPv4 or IPv6 rules separately.

However, if you already have configured generic IP ACL on a terminal line, then you cannot further apply IPv4 or IPv6 specific filtering on top of this configuration. Because, both IPv4 and IPv6 access classes are already configured on this terminal line. Before applying either IPv4 or IPv6 filtering, first undo the generic configuration using the `no access-class access-list-name` command.

Similarly, if you have configured either IPv4 or IPv6 specific filtering on a terminal line, you cannot apply generic IP ACLs on top of this configuration. Before applying the generic ACL configuration, first undo the existing configuration using the `no access-class access-list-name [ipv4 | ipv6]` command.

## clear counters ip access-group

Erase all counters maintained for access lists.

<b>Syntax</b>	<code>clear counters ip access-group [access-list-name]</code>	
<b>Parameters</b>	<b><i>access-list-name</i></b>	(OPTIONAL) Enter the name of a configured access-list, up to 140 characters.
<b>Command Modes</b>	EXEC Privilege	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .	

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.8.1.0	Increase the name string to accept up to 140 characters. Prior to 7.8.1.0, names were up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.2.1.1	Introduced on the E-Series.

## ip access-group

Assign an IP access list (IP ACL) to an interface.

**Syntax**

```
ip access-group access-list-name {in | out} [implicit-permit]
[vlan vlan-id] [vrf vrf-name]
```

To delete an IP access-group configuration, use the `no ip access-group access-list-name {in | out} [implicit-permit] [vlan vlan-id] [vrf vrf-name]` command.

Parameters	
<b><i>access-list-name</i></b>	Enter the name of a configured access list, up to 140 characters.
<b>in</b>	Enter the keyword <code>in</code> to apply the ACL to incoming traffic.
<b>out</b>	Enter the keyword <code>out</code> to apply the ACL to outgoing traffic.
<b>implicit-permit</b>	(OPTIONAL) Enter the keyword <code>implicit-permit</code> to change the default action of the ACL from implicit-deny to implicit-permit (that is, if the traffic does not match the filters in the ACL, the traffic is permitted instead of dropped).
<b>vlan <i>vlan-id</i></b>	(OPTIONAL) Enter the keyword <code>vlan</code> then the ID numbers of the VLANs. The range is from 1 to 4094 (you can use IDs from 1 to 4094).
<b>vrf <i>vrf-name</i></b>	(OPTIONAL) Enter the keyword <code>vrf</code> then the ID numbers of the VRFs. The range is from 1 to 63 (you can use IDs from 1 to 63).

**NOTE:** When you specify a single VRF, use the name of the VRF instead of the VRF ID number. Use the VRF ID numbers only when you specify a range of VRFs.

**Defaults** Not enabled.

**Command Modes** INTERFACE/VRF MODE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.4.(0.0)	Added support for VRF.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names were up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.2.1.1	Introduced on the E-Series.

**Usage Information** You can assign one ACL (standard or extended ACL) to an interface.

**NOTE:** This command supports Loopback interfaces EE3 and EF series route processor modules (RPMs). This command does not support Loopback interfaces ED series RPMs and S-Series Loopback interfaces.

**NOTE:** If you apply outbound(egress) IP acl on a switch port, the filter applies only for routed traffic egressing out of that port.

To associate an access-list to a non-default VRF, use the `vrf` attribute of this command. You can use this command at the interface context (physical/LAG) to apply the access-list to a range of VRFs.

The VRF MODE is not available for the default and management VRFs.

**Related Commands** [ip access-list standard](#) — configures a standard ACL.

[ip access-list extended](#) — configures an extended ACL.

## ip control-plane egress-filter

Enable egress Layer 3 ACL lookup for IPv4 CPU traffic.

**Syntax** `ip control-plane egress-filter`

**Defaults** Not enabled.

**Command Modes** EXEC Privilege

Command History	Version	Description
	9.7(0.0)	Introduced on the S6000-ON.
	9.0.2.0	Introduced on the S6000.
	8.3.19.0	Introduced on the S4820T.
	8.3.11.1	Introduced on the Z9000.
	8.3.7.0	Introduced on the S4810.

## show ip accounting access-list

Display the IP access-lists created on the switch and the sequence of filters.

**Syntax** `show ip accounting {access-list access-list-name | cam_count}  
interface interface [vrf vrf-name]`

Parameters		
<b>access-list-name</b>		Enter the name of the ACL to be displayed.
<b>cam_count</b>		List the count of the CAM rules for this ACL.
<b>interface interface</b>		Enter the keyword <code>interface</code> then the one of the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li></ul>
<b>in   out</b>		Identify whether ACL is applied on the ingress or egress side.
<b>vrf vrf-name</b>		(Optional) Enter the keyword <code>vrf</code> and then the name of the VRF to view the IP accounting information on either a default or a non-default VRF.

## Command Modes

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.4(0.0)	Added support for VRF.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.5.1.0	Added support for the 4-port 40G line cards on ExaScale.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.2.1.1	Introduced.

## Usage Information

<code>show ip accounting access-lists</code> Field	Description
"Extended IP..."	Displays the name of the IP ACL.
"seq 5..."	Displays the filter. If the keywords <code>count</code> or <code>byte</code> were configured in the filter, the number of packets or bytes the filter processes is displayed at the end of the line.
"order 4"	Displays the QoS order of priority for the ACL entry.

## Example

```
Dell#show ip accounting access-list
!
Standard Ingress IP access list test on TenGigabitEthernet 0/88
Total cam count 2
  seq 5 permit 1.1.1.0/24 count (0 packets)
  seq 10 deny 2.1.1.0/24 count (0 packets)

Dell#show ip accounting access-list L3-ACL vrf vrf3
!
Standard Ingress IP access list L3-ACL on vrf3
Total cam count 3
  seq 5 permit 10.1.2.0/24
  seq 10 permit 20.1.2.0/24
```

```
seq 15 permit 30.1.2.0/24
Del1#
```

## Standard IP ACL Commands

When you create an ACL without any rule and then apply it to an interface, the ACL behavior reflects an implicit permit.

The platform supports both Ingress and Egress IP ACLs.

 **NOTE:** Also refer to the [Commands Common to all ACL Types](#) and [Common IP ACL Commands](#) sections.

### deny

To drop packets with a certain IP address, configure a filter.

**Syntax** `deny {source | any | host {ip-address}} [no-drop]`

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny {source [mask] | any | host ip-address}` command.

### Parameters

<b>source</b>	Enter the IP address in dotted decimal format of the network from which the packet was sent.
<b>any</b>	Enter the keyword <code>any</code> to specify that all routes are subject to the filter. You can enter any of the following keywords to specify route types. <ul style="list-style-type: none"><li>• <code>bytes</code> — Enter the keyword <code>count</code> to count packets the filter processes.</li><li>• <code>count</code> — Enter the keyword <code>bytesorder</code> to count bytes the filter processes.</li><li>• <code>dscp</code> — Enter the keyword <code>dscp</code> followed by the DCSP value to match to the IP DCSCP values. The range is from 0 to 63.</li><li>• <code>fragments</code> — Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.</li><li>• <code>order</code> — Enter the keyword <code>order</code> to specify the QoS order of priority for the ACL entry. The range is from 0 to 254 (0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). The default is, if you do not use the keyword <code>order</code>, the ACLs have the lowest order by default (255).</li></ul>

**host *ip-address*** Enter the keyword `host` and then enter the IP address to specify a host IP address only.

**no-drop** Enter the keywords `no-drop` to match only the forwarded packets.

**Defaults** Not configured.

**Command Modes** CONFIGURATION-STANDARD-ACCESS-LIST

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.8(0.0)	Added the no-drop parameter.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Add the DSCP value for ACL matching.
8.2.1.0	Allows ACL control of fragmented packets for IP (Layer 3) ACLs.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added support for the non-contiguous mask and added the <code>monitor</code> option.
6.5.1.0	Expanded to include the optional QoS <code>order</code> priority for the ACL entry.

**Usage Information** The `order` option is relevant in the context of the Policy QoS feature only. For more information, refer to the Quality of Service chapter of the *Dell Networking OS Configuration Guide*.

The software cannot count both packets and bytes, so when you enter the `count` `byte` options, only bytes increment.

**Related Commands** [ip access-list standard](#) — configures a standard ACL.

[permit](#) — configures a permit filter.

## ip access-list standard

Create a standard IP access list (IP ACL) to filter based on IP address.

<b>Syntax</b>	<code>ip access-list standard <i>access-list-name</i></code> To delete an access list, use the <code>no ip access-list standard <i>access-list-name</i></code> command.
<b>Parameters</b>	<b><i>access-list-name</i></b> Enter a string up to 140 characters long as the ACL name.
<b>Defaults</b>	All IP access lists contain an implicit “deny any,” that is, if no match occurs, the packet is dropped.
<b>Command Modes</b>	CONFIGURATION
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.10.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.8.1.0	Increased the name string to accept up to 140 characters.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added support for the non-contiguous mask and added the <code>monitor</code> option.
6.5.1.0	Expanded to include the optional QoS <code>order</code> priority for the ACL entry.

<b>Usage Information</b>	Dell Networking OS supports one ingress and one egress IP ACL per interface. Prior to Dell Networking OS version 7.8.1.0, names are up to 16 characters long.
--------------------------	--

The number of entries allowed per ACL is hardware-dependent. For detailed specifications on entries allowed per ACL, refer to your line card documentation.

#### Example

```
Dell(conf)#ip access-list standard TestList
Dell(config-std-nacl)#
```

#### Related Commands

[ip access-list extended](#) — creates an extended access list.

[show config](#) — displays the current configuration.

## permit

To permit packets from a specific source IP address to leave the switch, configure a filter.

#### Syntax

```
permit {source [mask] | any | host ip-address} [no-drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit {source [mask] | any | host ip-address}` command.

#### Parameters

<b>source</b>	Enter the IP address in dotted decimal format of the network from which the packet was sent.
<b>mask</b>	(OPTIONAL) Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
<b>any</b>	Enter the keyword <code>any</code> to specify that all routes are subject to the filter. You can enter any of the following keywords to specify route types. <ul style="list-style-type: none"><li>• <code>bytes</code> — Enter the keyword <code>bytes</code> to count bytes processed by the filter.</li><li>• <code>count</code> — Enter the keyword <code>count</code> to count packets the filter processes.</li><li>• <code>dscp</code> — Enter the keyword <code>dscp</code> to match to the IP DSCP values.</li><li>• <code>fragments</code> — Enter the keyword <code>fragments</code> to match to non-initial fragments of a datagram.</li><li>• <code>order</code> — Enter the keyword <code>order</code> to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword <code>order</code>, the ACLs have the lowest order by default (255).</li></ul>
<b>host ip-address</b>	Enter the keyword <code>host</code> then the IP address to specify a host IP address or hostname.

**no-drop** Enter the keywords `no-drop` to match only the forwarded packets.

**Defaults** Not configured.

**Command Modes** CONFIGURATION-STANDARD-ACCESS-LIST

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.8(0.0)	Added the <code>no-drop</code> parameter.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Add the DSCP value for ACL matching.
8.2.1.0	Allows ACL control of fragmented packets for IP (Layer 3) ACLs.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added support for the non-contiguous mask and added the <code>monitor</code> option.
6.5.10	Expanded to include the optional QoS <code>order</code> priority for the ACL entry.

**Usage Information** The `order` option is relevant in the context of the Policy QoS feature only. For more information, refer to the "Quality of Service" chapter of the *Dell Networking OS Configuration Guide*.

**Related Commands** [deny](#) — assigns a IP ACL filter to deny IP packets.  
[ip access-list standard](#) — creates a standard ACL.

## resequence access-list

Re-assign sequence numbers to entries of an existing access-list.

<b>Syntax</b>	resequence access-list {ipv4   ipv6   mac} {access-list-name StartingSeqNum Step-to-Increment}	
<b>Parameters</b>	<b>ipv4   ipv6   mac</b>	Enter the keyword <code>ipv4</code> or <code>mac</code> to identify the access list type to resequence.
	<b>access-list-name</b>	Enter the name of a configured IP access list.
	<b>StartingSeqNum</b>	Enter the starting sequence number to resequence. The range is from 0 to 4294967290.
	<b>Step-to-Increment</b>	Enter the step to increment the sequence number. The range is from 1 to 4294967290.
<b>Defaults</b>	none	
<b>Command Modes</b>	<ul style="list-style-type: none"><li>EXEC</li><li>EXEC Privilege</li></ul>	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .	

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the E-Series ExaScale (IPv6).
8.1.1.0	Introduced on the E-Series ExaScale (IPv4).
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names were up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Introduced on the E-Series.

## Usage Information

When you have exhausted all the sequence numbers, this feature permits re-assigning a new sequence number to entries of an existing access-list.

## resequence prefix-list ipv4

Re-assign sequence numbers to entries of an existing prefix list.

### Syntax

```
resequence prefix-list ipv4 {prefix-list-name StartingSeqNum Step-to-increment}
```

### Parameters

<b><i>prefix-list-name</i></b>	Enter the name of the configured prefix list, up to 140 characters long.
<b><i>StartingSeqNum</i></b>	Enter the starting sequence number to resequence. The range is from 0 to 65535.
<b><i>Step-to-Increment</i></b>	Enter the step to increment the sequence number. The range is from 1 to 65535.

### Defaults

none

### Command Modes

- EXEC
- EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

<b>Version 9.0.2.0</b>	Introduced on the S6000.
<b>Version 8.3.11.1</b>	Introduced on the Z9000.
<b>Version 8.1.1.0</b>	Introduced on the E-Series ExaScale
<b>Version 7.8.1.0</b>	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names were up to 16 characters long.
<b>Version 7.6.1.0</b>	Introduced on the S-Series.
<b>Version 7.5.1.0</b>	Introduced on the C-Series.
<b>Version 7.4.1.0</b>	Introduced on the E-Series.

## Usage Information

When you have exhausted all the sequence numbers, this feature permits re-assigning a new sequence number to entries of an existing prefix list.

## Related Commands

[resequence access-list](#) — resequences an access-list.

## seq

Assign a sequence number to a deny or permit filter in an IP access list while creating the filter.

**Syntax** `seq sequence-number {deny | permit} {source [mask] | any | host ip-address}} [count [bytes]] [dscp value] [order] [fragments] [no-drop]`

To delete a filter, use the `no seq sequence-number` command.

### Parameters

<b>sequence-number</b>	Enter a number from 0 to 4294967290. The range is from 0 to 65534.
<b>deny</b>	Enter the keyword <code>deny</code> to configure a filter to drop packets meeting this condition.
<b>permit</b>	Enter the keyword <code>permit</code> to configure a filter to forward packets meeting this criteria.
<b>source</b>	Enter an IP address in dotted decimal format of the network from which the packet was received.
<b>mask</b>	(OPTIONAL) Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
<b>any</b>	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
<b>host ip-address</b>	Enter the keyword <code>host</code> then the IP address to specify a host IP address or hostname.
<b>count</b>	(OPTIONAL) Enter the keyword <code>count</code> to count packets the filter processes.
<b>bytes</b>	(OPTIONAL) Enter the keyword <code>bytes</code> to count bytes the filter processes.
<b>dscp</b>	(OPTIONAL) Enter the keyword <code>dscp</code> to match to the IP DSCP values.
<b>order</b>	(OPTIONAL) Enter the keyword <code>order</code> to specify the QoS order for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).
<b>fragments</b>	Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.
<b>no-drop</b>	Enter the keywords <code>no-drop</code> to match only the forwarded packets.

**Defaults** Not configured

**Command Modes** CONFIGURATION-STANDARD-ACCESS-LIST

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.8(0.0)	Added the no-drop parameter.
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Add the DSCP value for ACL matching.
8.2.1.0	Allows ACL control of fragmented packets for IP (Layer 3) ACLs.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added support for the non-contiguous mask and added the <code>monitor</code> option.
6.5.10	Expanded to include the optional QoS <code>order</code> priority for the ACL entry.

**Usage Information** The `order` option is relevant in the context of the Policy QoS feature only. The following applies:

- The `seq sequence-number` command is applicable only in an ACL group.
- The `order` option works across ACL groups that are applied on an interface via the QoS policy framework.
- The `order` option takes precedence over `seq sequence-number`.
- If you do not configure `sequence-number`, the rules with the same order value are ordered according to their configuration order.
- If you configure `sequence-number`, the sequence-number is used as a tie breaker for rules with the same order.

**Related Commands** [deny](#) — configures a filter to drop packets.

[permit](#) — configures a filter to forward packets.

## Extended IP ACL Commands

When an ACL is created without any rule and then applied to an interface, ACL behavior reflects an implicit permit.

The following commands configure extended IP ACLs, which in addition to the IP address, also examine the packet's protocol type.

The platform supports both Ingress and Egress IP ACLs.

 **NOTE:** Also refer to the [Commands Common to all ACL Types](#) and [Common IP ACL Commands](#) sections.

### deny

Configure a filter that drops IP packets meeting the filter criteria.

**Syntax** `deny {ip | ip-protocol-number} {source mask | any | host ip-address} {destination mask | any | host ip-address} [count [byte] | log] [dscp value] [order] [monitor] [fragments] [no-drop]`

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny {ip | ip-protocol-number} {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

### Parameters

<b>ip</b>	Enter the keyword <code>ip</code> to configure a generic IP access list. The keyword <code>ip</code> specifies that the access list denies all IP protocols.
<b>ip-protocol-number</b>	Enter a number from 0 to 255 to deny based on the protocol identified in the IP protocol header.
<b>source</b>	Enter the IP address of the network or host from which the packets were sent.
<b>mask</b>	Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or noncontiguous.
<b>any</b>	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
<b>host ip-address</b>	Enter the keyword <code>host</code> then the IP address to specify a host IP address.
<b>destination</b>	Enter the IP address of the network or host to which the packets are sent.

<b>count</b>	(OPTIONAL) Enter the keyword <code>count</code> to count packets that the filter processes.
<b>byte</b>	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes that the filter processes.
<b>log</b>	(OPTIONAL, E-Series only) Enter the keyword <code>log</code> to enter ACL matches in the log.
<b>dscp</b>	(OPTIONAL) Enter the keyword <code>dscp</code> to match to the IP DSCP values.
<b>order</b>	(OPTIONAL) Enter the keyword <code>order</code> to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, refer to the "Flow-based Monitoring" section in the Port Monitoring chapter of the <i>Dell Networking OS Configuration Guide</i> .
<b>fragments</b>	Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.
<b>no-drop</b>	Enter the keywords <code>no-drop</code> to match only the forwarded packets.

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION-EXTENDED-ACCESS-LIST

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

<b>Version</b>	<b>Description</b>
<b>9.8(0.0)</b>	Added the no-drop parameter.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.3.1.0</b>	Add the DSCP value for ACL matching.

Version	Description
8.2.1.0	Allows ACL control of fragmented packets for IP (Layer 3) ACLs.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added support for the noncontiguous mask and added the <code>monitor</code> option.
6.5.1.0	Expanded to include the optional QoS <code>order</code> priority for the ACL entry.

### Usage Information

The `order` option is relevant in the context of the Policy QoS feature only. For more information, refer to the Quality of Service chapter of the *Dell Networking OS Configuration Guide*.

When you use the `log` option, the CP processor logs detail the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets' details.

The `monitor` option is relevant in the context of flow-based monitoring only. For more information, refer to the [Port Monitoring](#) chapter.

The C-Series and S-Series cannot count both packets and bytes, when you enter the count byte options, only bytes are incremented.

**NOTE:** When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

### Related Commands

[deny tcp](#) — assigns a filter to deny TCP packets.

[deny udp](#) — assigns a filter to deny UDP packets.

[ip access-list extended](#) — creates an extended ACL.

## deny icmp

To drop all or specific internet control message protocol (ICMP) messages, configure a filter.

### Syntax

```
deny icmp {source mask | any | host ip-address} {destination
mask | any | host ip-address} [dscp] [count [byte] [order]
[fragments] [no-drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.

- Use the `no deny icmp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

## Parameters

<b>source</b>	Enter the IP address of the network or host from which the packets were sent.
<b>mask</b>	Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
<b>any</b>	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
<b>host ip-address</b>	Enter the keyword <code>host</code> then the IP address to specify a host IP address.
<b>destination</b>	Enter the IP address of the network or host to which the packets are sent.
<b>dscp</b>	Enter this keyword <code>dscp</code> to deny a packet based on the DSCP value. The range is from 0 to 63.
<b>count</b>	(OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.
<b>byte</b>	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes processed by the filter.
<b>order</b>	(OPTIONAL) Enter the keyword <code>order</code> to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower order numbers have a higher priority) If you did not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).
<b>fragments</b>	Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.
<b>no-drop</b>	Enter the keywords <code>no-drop</code> to match only the forwarded packets.

## Defaults

Not configured.

## Command Modes

CONFIGURATION-EXTENDED-ACCESS-LIST

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.8(0.0)	Added the no-drop parameter.
9.7(0.0)	Introduced on the S6000-ON.

Version	Description
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Added the keyword <code>dscp</code> .
8.2.1.0	Allows ACL control of fragmented packets for IP (Layer 3) ACLs.
8.1.1.0	Introduced on the E-Series ExaScale.
7.4.1.0	Added support for non-contiguous mask and added the <code>monitor</code> option.
6.5.1.0	Expanded to include the optional QoS <code>order</code> priority for the ACL entry.

#### Usage Information

The `order` option is relevant in the context of the Policy QoS feature only. For more information, refer to the Quality of Service chapter of the *Dell Networking OS Configuration Guide*.

The `monitor` option is relevant in the context of flow-based monitoring only. For more information, refer to the [Port Monitoring](#) chapter.

## deny tcp

Configure a filter that drops transmission control protocol (TCP) packets meeting the filter criteria.

#### Syntax

```
deny tcp {source mask | any | host ip-address} [bit] [operator port [port]] {destination mask | any | host ip-address} [dscp] [bit] [operator port [port]] [count [byte] [order] [fragments] [no-drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny tcp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

#### Parameters

<b>source</b>	Enter the IP address of the network or host from which the packets are sent.
<b>mask</b>	Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
<b>any</b>	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.

<b>host <i>ip-address</i></b>	Enter the keyword <code>host</code> then the IP address to specify a host IP address.
<b>dscp</b>	Enter this keyword <code>dscp</code> to deny a packet based on the DSCP value. The range is from 0 to 63.
<b>bit</b>	Enter a flag or combination of bits: <ul style="list-style-type: none"> <li>• <code>ack</code>: acknowledgement field</li> <li>• <code>fin</code>: finish (no more data from the user)</li> <li>• <code>psh</code>: push function</li> <li>• <code>rst</code>: reset the connection</li> <li>• <code>syn</code>: synchronize sequence numbers</li> <li>• <code>urg</code>: urgent field</li> </ul>
<b>operator</b>	(OPTIONAL) Enter one of the following logical operand: <ul style="list-style-type: none"> <li>• <code>eq</code> = equal to</li> <li>• <code>neq</code> = not equal to</li> <li>• <code>gt</code> = greater than</li> <li>• <code>lt</code> = less than</li> <li>• <code>range</code> = inclusive range of ports (you must specify two ports for the <code>port</code> command)</li> </ul>
<b>port <i>port</i></b>	Enter the application layer port number. Enter two port numbers if using the range logical operand. The range is from 0 to 65535.  The following list includes some common TCP port numbers: <ul style="list-style-type: none"> <li>• 23 = Telnet</li> <li>• 20 and 21 = FTP</li> <li>• 25 = SMTP</li> <li>• 169 = SNMP</li> </ul>
<b>destination</b>	Enter the IP address of the network or host to which the packets are sent.
<b>mask</b>	Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
<b>count</b>	(OPTIONAL) Enter the keyword <code>count</code> to count packets the filter processes.
<b>byte</b>	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes the filter processes.
<b>order</b>	(OPTIONAL) Enter the keyword <code>order</code> to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order

numbers have a higher priority) If you did not use the keyword `order`, the ACLs have the lowest order by default (255).

- fragments** Enter the keyword `fragments` to use ACLs to control packet fragments.
- no-drop** Enter the keywords `no-drop` to match only the forwarded packets.

**Defaults** Not configured.

**Command Modes** CONFIGURATION-EXTENDED-ACCESS-LIST

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.8(0.0)	Added the no-drop parameter.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Added the keyword <code>dscp</code> .
8.2.1.0	Allows ACL control of fragmented packets for IP (Layer 3) ACLs.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added support for non-contiguous mask and added the <code>monitor</code> option. Deprecated the keyword <code>established</code> .
6.5.1.0	Expanded to include the optional QoS <code>order</code> priority for the ACL entry.

**Usage Information** The `order` option is relevant in the context of the Policy QoS feature only. For more information, refer to the Quality of Service chapter of the *Dell Networking OS Configuration Guide*.

The `monitor` option is relevant in the context of flow-based monitoring only. For more information, refer to the [Port Monitoring](#) chapter.

The C-Series and S-Series cannot count both packets and bytes; when you enter the count byte options, only bytes are incremented.

**NOTE:** When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

Most ACL rules require one entry in the CAM. However, rules with TCP and UDP port operators (for example, gt, lt, or range) may require more than one entry. The range of ports is configured in the CAM based on bit mask boundaries; the space required depends on exactly what ports are included in the range.

#### Example

An ACL rule with a TCP port range of 4000–8000 uses eight entries in the CAM.

Rule#	Data	Mask	From	To	#Covered
1	0000111110100000	1111111111100000	4000	4031	32
2	0000111111000000	1111111111100000	4032	4095	64
3	0001000000000000	1111100000000000	4096	6143	2048
4	0001100000000000	1111110000000000	6144	7167	1024
5	0001110000000000	1111111000000000	7168	7679	512
6	0001111000000000	1111111100000000	7680	7935	256
7	0001111100000000	1111111110000000	7936	7999	64
8	0001111101000000	1111111111111111	8000	8000	1

Total Ports: 4001

#### Example

An ACL rule with a TCP port lt 1023 uses only one entry in the CAM.

Rule#	Data	Mask	From	To	#Covered
1	0000000000000000	1111110000000000	0	1023	1024

Total Ports: 1024

#### Related Commands

[deny](#) — assigns a filter to deny IP traffic.

[deny udp](#) — assigns a filter to deny UDP traffic.

## deny udp

To drop user datagram protocol (UDP) packets meeting the filter criteria, configure a filter.

#### Syntax

```
deny udp {source mask | any | host ip-address} [operator port  
[port]] {destination mask | any | host ip-address} [dscp]  
[operator port [port]] [count [byte] [order] [fragments] [no-  
drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.

- Use the `no deny udp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

## Parameters

<b>source</b>	Enter the IP address of the network or host from which the packets were sent.
<b>mask</b>	Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
<b>any</b>	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
<b>host ip-address</b>	Enter the keyword <code>host</code> then the IP address to specify a host IP address.
<b>dscp</b>	Enter this keyword <code>dscp</code> to deny a packet based on the DSCP value. The range is from 0 to 63.
<b>operator</b>	(OPTIONAL) Enter one of the following logical operand: <ul style="list-style-type: none"> <li>• <code>eq</code> = equal to</li> <li>• <code>neq</code> = not equal to</li> <li>• <code>gt</code> = greater than</li> <li>• <code>lt</code> = less than</li> <li>• <code>range</code> = inclusive range of ports (you must specify two ports for the <code>port</code> command)</li> </ul>
<b>port port</b>	Enter the application layer port number. Enter two port numbers if using the range logical operand. The range is from 0 to 65535.
<b>destination</b>	Enter the IP address of the network or host to which the packets are sent.
<b>mask</b>	Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
<b>count</b>	(OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.
<b>byte</b>	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes processed by the filter.
<b>order</b>	(OPTIONAL) Enter the keyword <code>order</code> to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority) If you did not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).
<b>fragments</b>	Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.

**no-drop** Enter the keywords `no-drop` to match only the forwarded packets.

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION-EXTENDED-ACCESS-LIST

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.8(0.0)	Added the <code>no-drop</code> parameter.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Added the keyword <code>dscp</code> .
8.2.1.0	Allows ACL control of fragmented packets for IP (Layer 3) ACLs.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added support for non-contiguous mask and added the <code>monitor</code> option. Deprecated the keyword <code>established</code> .
6.5.1.0	Expanded to include the optional QoS <code>order</code> priority for the ACL entry.

**Usage Information**

The `order` option is relevant in the context of the Policy QoS feature only. For more information, refer to the Quality of Service chapter of the *Dell Networking OS Configuration Guide*.

The `monitor` option is relevant in the context of flow-based monitoring only. For more information, refer to the [Port Monitoring](#) chapter.

The C-Series and S-Series cannot count both packets and bytes; when you enter the count byte options, only bytes are incremented.

**NOTE:** When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

Most ACL rules require one entry in the CAM. However, rules with TCP and UDP port operators (for example, gt, lt or range) may require more than one entry. The range of ports is configured in the CAM based on bit mask boundaries; the space required depends on exactly what ports are included in the range.

**Example**

An ACL rule with a TCP port range of 4000–8000 uses eight entries in the CAM.

Rule#	Data	Mask	From	To	#Covered
1	0000111110100000	1111111111000000	4000	4031	32
2	0000111111000000	1111111111000000	4032	4095	64
3	0001000000000000	1111100000000000	4096	6143	2048
4	0001100000000000	1111110000000000	6144	7167	1024
5	0001110000000000	1111111000000000	7168	7679	512
6	0001111000000000	1111111100000000	7680	7935	256
7	0001111100000000	1111111110000000	7936	7999	64
8	0001111101000000	1111111111111111	8000	8000	1

Total Ports: 4001

**Example**

An ACL rule with a TCP port lt 1023 uses only one entry in the CAM.

Rule#	Data	Mask	From	To	#Covered
1	0000000000000000	1111110000000000	0	1023	1024

Total Ports: 1024

**Related Commands**

[deny](#) — assigns a filter to deny IP traffic.

[deny tcp](#) — assigns a filter to deny TCP traffic.

## ip access-list extended

Name (or select) an extended IP access list (IP ACL) based on IP addresses or protocols.

**Syntax**

`ip access-list extended access-list-name`

To delete an access list, use the `no ip access-list extended access-list-name` command.

**Parameters**

***access-list-name*** Enter a string up to 140 characters long as the access list name.

**Defaults**

All access lists contain an implicit “deny any”; that is, if no match occurs, the packet is dropped.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.10.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names were up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.2.1.1	Introduced on the E-Series.

**Usage Information** The number of entries allowed per ACL is hardware-dependent. For detailed specification about entries allowed per ACL, refer to your line card documentation. Prior to 7.8.1.0, names are up to 16 characters long.

**Example**  
Dell(conf)#ip access-list extended TESTListEXTEND  
Dell(config-ext-nacl)#

**Related Commands**  
[ip access-list standard](#) — configures a standard IP access list.  
[show config](#) — displays the current configuration.

## permit

To pass IP packets meeting the filter criteria, configure a filter.

**Syntax**  
`permit {source mask | any | host ip-address} {destination mask | any | host ip-address} [count [bytes]] [dscp value] [order] [fragments] [no-drop]`

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

**Parameters**  
**source** Enter the IP address in dotted decimal format of the network from which the packet was sent.

<b>mask</b>	(OPTIONAL) Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
<b>any</b>	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
<b>host ip-address</b>	Enter the keyword <code>host</code> then the IP address to specify a host IP address or hostname.
<b>destination</b>	Enter the IP address of the network or host to which the packets are sent.
<b>count</b>	(OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.
<b>bytes</b>	(OPTIONAL) Enter the keyword <code>bytes</code> to count bytes processed by the filter.
<b>dscp</b>	(OPTIONAL) Enter the keyword <code>dscp</code> to match to the IP DSCP values.
<b>order</b>	(OPTIONAL) Enter the keyword <code>order</code> to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).
<b>fragments</b>	Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.
<b>no-drop</b>	Enter the keywords <code>no-drop</code> to match only the forwarded packets.

**Defaults** Not configured.

**Command Modes** CONFIGURATION-EXTENDED-ACCESS-LIST

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

<b>Version</b>	<b>Description</b>
<b>9.8(0.0)</b>	Added the no-drop parameter.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.

Version	Description
8.3.1.0	Add the DSCP value for ACL matching.
8.2.1.0	Allows ACL control of fragmented packets for IP (Layer 3) ACLs.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added support for the non-contiguous mask and added the <code>monitor</code> option.
6.5.10	Expanded to include the optional QoS <code>order</code> priority for the ACL entry.

#### Usage Information

The `order` option is relevant in the context of the Policy QoS feature only. For more information, refer to the “Quality of Service” chapter of the *Dell Networking OS Configuration Guide*.

The software cannot count both packets and bytes; when you enter the count byte options, only bytes are incremented.

#### Related Commands

[ip access-list extended](#) — creates an extended ACL.

[permit tcp](#) — assigns a permit filter for TCP packets.

[permit udp](#) — assigns a permit filter for UDP packets.

## permit tcp

To pass TCP packets meeting the filter criteria, configure a filter.

#### Syntax

```
permit tcp {source mask | any | host ip-address} [bit]
[operator port [port]] {destination mask | any | host ip-
address} [bit] [dscp] [operator port [port]] [count [byte]
[order] [fragments] [no-drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no permit tcp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

#### Parameters

**source** Enter the IP address of the network or host from which the packets were sent.

<b><i>mask</i></b>	Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
<b><i>any</i></b>	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
<b><i>host ip-address</i></b>	Enter the keyword <code>host</code> then the IP address to specify a host IP address.
<b><i>bit</i></b>	Enter a flag or combination of bits: <ul style="list-style-type: none"> <li>• <code>ack</code>: acknowledgement field</li> <li>• <code>fin</code>: finish (no more data from the user)</li> <li>• <code>psh</code>: push function</li> <li>• <code>rst</code>: reset the connection</li> <li>• <code>syn</code>: synchronize sequence numbers</li> <li>• <code>urg</code>: urgent field</li> </ul>
<b><i>dscp</i></b>	Enter the keyword <code>dscp</code> to deny a packet based on the DSCP value. The range is from 0 to 63.
<b><i>operator</i></b>	(OPTIONAL) Enter one of the following logical operand: <ul style="list-style-type: none"> <li>• <code>eq</code> = equal to</li> <li>• <code>neq</code> = not equal to</li> <li>• <code>gt</code> = greater than</li> <li>• <code>lt</code> = less than</li> <li>• <code>range</code> = inclusive range of ports (you must specify two ports for the port parameter)</li> </ul>
<b><i>port port</i></b>	Enter the application layer port number. Enter two port numbers if you are using the range logical operand. The range is from 0 to 65535. The following list includes some common TCP port numbers: <ul style="list-style-type: none"> <li>• 23 = Telnet</li> <li>• 20 and 21 = FTP</li> <li>• 25 = SMTP</li> <li>• 169 = SNMP</li> </ul>
<b><i>destination</i></b>	Enter the IP address of the network or host to which the packets are sent.
<b><i>mask</i></b>	Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
<b><i>count</i></b>	(OPTIONAL) Enter the keyword <code>count</code> to count packets the filter processes.

<b>byte</b>	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes the filter processes.
<b>order</b>	(OPTIONAL) Enter the keyword <code>order</code> to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).
<b>fragments</b>	Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.
<b>no-drop</b>	Enter the keywords <code>no-drop</code> to match only the forwarded packets.

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION-EXTENDED-ACCESS-LIST

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

<b>Version</b>	<b>Description</b>
<b>9.8(0.0)</b>	Added the <code>no-drop</code> parameter.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.

<b>8.1.1.0</b>	Introduced on the E-Series ExaScale.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>7.4.1.0</b>	Added support for non-contiguous mask and added the <code>monitor</code> option. Deprecated the keyword <code>established</code> .
<b>6.5.10</b>	Expanded to include the optional QoS <code>order</code> priority for the ACL entry.

## Usage Information

The `order` option is relevant in the context of the Policy QoS feature only. For more information, refer to the “Quality of Service” chapter of the *Dell Networking OS Configuration Guide*.

**NOTE:** When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

The S-Series cannot count both packets and bytes; when you enter the count byte options, only bytes increment.

The `monitor` option is relevant in the context of flow-based monitoring only. For more information, refer to [Port Monitoring](#).

Most ACL rules require one entry in the CAM. However, rules with TCP and UDP port operators (for example, `gt`, `lt`, or `range`) may require more than one entry. The range of ports is configured in the CAM based on bit mask boundaries; the space required depends on exactly what ports are included in the range.

## Example

An ACL rule with a TCP port range of 4000–8000 uses eight entries in the CAM.

Rule#	Data	Mask	From	To	#Covered
1	0000111110100000	1111111111100000	4000	4031	32
2	0000111111000000	1111111111100000	4032	4095	64
3	0001000000000000	1111100000000000	4096	6143	2048
4	0001100000000000	1111110000000000	6144	7167	1024
5	0001110000000000	1111111000000000	7168	7679	512
6	0001111000000000	1111111100000000	7680	7935	256
7	0001111100000000	1111111110000000	7936	7999	64
8	0001111101000000	1111111111111111	8000	8000	1

Total Ports: 4001

## Example

An ACL rule with a TCP port `lt 1023` uses only one entry in the CAM.

Rule#	Data	Mask	From	To	#Covered
1	0000000000000000	1111110000000000	0	1023	1024

Total Ports: 1024

## Related Commands

[ip access-list extended](#) — creates an extended ACL.

[permit](#) — assigns a permit filter for IP packets.

[permit udp](#) — assigns a permit filter for UDP packets.

## permit udp

To pass UDP packets meeting the filter criteria, configure a filter.

**Syntax** `permit udp {source mask | any | host ip-address} [operator port [port]] {destination mask | any | host ip-address} [dscp] [operator port [port]] [count [byte] [order] [fragments] [no-drop]`

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit udp {source mask | any | host ip-address} {destination mask | any | host ip-address` command.

### Parameters

<b><i>source</i></b>	Enter the IP address of the network or host from which the packets were sent.
<b><i>mask</i></b>	Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
<b><i>any</i></b>	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
<b><i>host ip-address</i></b>	Enter the keyword <code>host</code> and then enter the IP address to specify a host IP address.
<b><i>dscp</i></b>	Enter the keyword <code>dscp</code> to deny a packet based on the DSCP value. The range is from 0 to 63.
<b><i>operator</i></b>	(OPTIONAL) Enter one of the following logical operand: <ul style="list-style-type: none"><li>• <code>eq</code> = equal to</li><li>• <code>neq</code> = not equal to</li><li>• <code>gt</code> = greater than</li><li>• <code>lt</code> = less than</li><li>• <code>range</code> = inclusive range of ports (you must specify two ports for the <code>port</code> parameter)</li></ul>
<b><i>port port</i></b>	Enter the application layer port number. Enter two port numbers if you are using the <code>range</code> logical operand. The range is 0 to 65535.
<b><i>destination</i></b>	Enter the IP address of the network or host to which the packets are sent.
<b><i>count</i></b>	(OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.
<b><i>byte</i></b>	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes processed by the filter.

<b>order</b>	(OPTIONAL) Enter the keyword <code>order</code> to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).
<b>fragments</b>	Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.
<b>no-drop</b>	Enter the keywords <code>no-drop</code> to match only the forwarded packets.

**Defaults** Not configured.

**Command Modes** CONFIGURATION-EXTENDED-ACCESS-LIST

1	0000000000000000	1111110000000000	0	1023	1024

Total Ports: 1024

### Related Commands

[ip access-list extended](#) — creates an extended ACL.

[permit](#) — assigns a permit filter for IP packets.

[permit tcp](#) — assigns a permit filter for TCP packets.

## resequence access-list

Re-assign sequence numbers to entries of an existing access-list.

**Syntax** `resequence access-list {ipv4 | mac} {access-list-name StartingSeqNum Step-to-Increment}`

**Parameters** `ipv4 | mac` Enter the keyword `ipv4` or `mac` to identify the access list type to resequence.

***access-list-name*** Enter the name of a configured IP access list, up to 140 characters.

***StartingSeqNum*** Enter the starting sequence number to resequence. The range is from 0 to 4294967290.

***Step-to-Increment*** Enter the step to increment the sequence number. The range is from 1 to 4294967290.

**Defaults** none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

<b>Version</b>	<b>Description</b>
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series ExaScale (IPv4).
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names were up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Introduced on the E-Series.

**Usage Information** When all sequence numbers are exhausted, this feature permits re-assigning a new sequence number to entries of an existing access-list.

## resequence prefix-list ipv4

Re-assign sequence numbers to entries of an existing prefix list.

**Syntax** `resequence prefix-list ipv4 {prefix-list-name StartingSeqNum Step-to-increment}`

**Parameters**

***prefix-list-name*** Enter the name of the configured prefix list, up to 140 characters long.

***StartingSeqNum*** Enter the starting sequence number to resequence. The range is from 0 to 65535.

	<b>Step-to-Increment</b>	Enter the step to increment the sequence number. The range is from 1 to 65535.
<b>Defaults</b>		none
<b>Command Modes</b>		<ul style="list-style-type: none"> <li>• EXEC</li> <li>• EXEC Privilege</li> </ul>

<b>Usage Information</b>		When you have exhausted all the sequence numbers, this feature permits re-assigning a new sequence number to entries of an existing prefix list.
<b>Related Commands</b>		<a href="#">resequence access-list</a> — resequences an access-list.

## seq

Assign a sequence number to a deny or permit filter in an extended IP access list while creating the filter.

<b>Syntax</b>		<code>seq sequence-number {deny   permit} {ip-protocol-number   icmp   ip   tcp   udp} {source mask   any   host ip-address} {destination mask   any   host ip-address} [operator port [port]] [count [byte]   log] [dscp value] [order] [monitor] [fragments] [no-drop]</code>
<b>Parameters</b>	<b>sequence-number</b>	Enter a number from 0 to 4294967290. The range is from 0 to 65534.
	<b>deny</b>	Enter the keyword <code>deny</code> to configure a filter to drop packets meeting this condition.
	<b>permit</b>	Enter the keyword <code>permit</code> to configure a filter to forward packets meeting this criteria.

<b><i>ip-protocol-number</i></b>	Enter a number from 0 to 255 to filter based on the protocol identified in the IP protocol header.
<b><i>icmp</i></b>	Enter the keyword <code>icmp</code> to configure an ICMP access list filter.
<b><i>ip</i></b>	Enter the keyword <code>ip</code> to configure a generic IP access list. The keyword <code>ip</code> specifies that the access list permits all IP protocols.
<b><i>tcp</i></b>	Enter the keyword <code>tcp</code> to configure a TCP access list filter.
<b><i>udp</i></b>	Enter the keyword <code>udp</code> to configure a UDP access list filter.
<b><i>source</i></b>	Enter an IP address in dotted decimal format of the network from which the packet was received.
<b><i>mask</i></b>	(OPTIONAL) Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
<b><i>any</i></b>	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
<b><i>host ip-address</i></b>	Enter the keyword <code>host</code> and then enter the IP address to specify a host IP address or hostname.
<b><i>operator</i></b>	(OPTIONAL) Enter one of the following logical operands: <ul style="list-style-type: none"> <li>• <code>eq</code> = equal to</li> <li>• <code>neq</code> = not equal to</li> <li>• <code>gt</code> = greater than</li> <li>• <code>lt</code> = less than</li> <li>• <code>range</code> = inclusive range of ports (you must specify two ports for the <code>port</code> parameter.)</li> </ul>
<b><i>port port</i></b>	(OPTIONAL) Enter the application layer port number. Enter two port numbers if you are using the range logical operand. The range is from 0 to 65535.  The following list includes some common TCP port numbers: <ul style="list-style-type: none"> <li>• 23 = Telnet</li> <li>• 20 and 21 = FTP</li> <li>• 25 = SMTP</li> <li>• 169 = SNMP</li> </ul>
<b><i>destination</i></b>	Enter the IP address of the network or host to which the packets are sent.
<b><i>count</i></b>	(OPTIONAL) Enter the keyword <code>count</code> to count packets the filter processes.
<b><i>byte</i></b>	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes the filter processes.

<b>log</b>	(OPTIONAL, E-Series only) Enter the keyword <code>log</code> to enter ACL matches in the log. Supported on Jumbo-enabled line cards only.
<b>dscp</b>	(OPTIONAL) Enter the keyword <code>dscp</code> to match to the IP DSCP values.
<b>order</b>	(OPTIONAL) Enter the keyword <code>order</code> to specify the QoS order for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword <code>order</code> , the ACLs have the lowest order by default (255).
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.
	 <b>NOTE:</b> For more information, refer to the Flow-based Monitoring section in the Port Monitoring chapter of the <i>Dell Networking OS Configuration Guide</i> .
<b>fragments</b>	Enter the keyword <code>fragments</code> to use ACLs to control packet fragments.
<b>no-drop</b>	Enter the keywords <code>no-drop</code> to match only the forwarded packets.

**Defaults**

Not configured

**Command Modes**

CONFIGURATION-EXTENDED-ACCESS-LIST

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

<b>Version</b>	<b>Description</b>
<b>9.8(0.0)</b>	Added the no-drop parameter.
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.3.1.0</b>	Add the DSCP value for ACL matching.
<b>8.2.1.0</b>	Allows ACL control of fragmented packets for IP (Layer 3) ACLs.

Version	Description
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added support for the non-contiguous mask and added the <code>monitor</code> option. Deprecated the keyword <code>established</code> .
6.5.10	Expanded to include the optional QoS <code>order</code> priority for the ACL entry.

## Usage Information

The `monitor` option is relevant in the context of flow-based monitoring only. For more information, refer to [Port Monitoring](#).

The `order` option is relevant in the context of the Policy QoS feature only. The following applies:

- The `seq sequence-number` command is applicable only in an ACL group.
- The `order` option works across ACL groups that are applied on an interface via the QoS policy framework.
- The `order` option takes precedence over `seq sequence-number`.
- If you do not configure `sequence-number`, the rules with the same order value are ordered according to their configuration order.
- If you configure `sequence-number`, the sequence-number is used as a tie breaker for rules with the same order.

When you use the `log` option, the CP processor logs details about the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets' details.

If you configure the `sequence-number`, the `sequence-number` is used as a tie breaker for rules with the same order.

**NOTE:** When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

## Related Commands

[deny](#) — configures a filter to drop packets.

[permit](#) — configures a filter to forward packets.

# Common MAC Access List Commands

The following commands are available within both MAC ACL modes (Standard and Extended) and do not have mode-specific options. These commands allow you to clear, display, and assign MAC ACL configurations.

The platform supports both Ingress and Egress MAC ACLs.

The MAC ACL can be applied on Physical, Port-channel and VLAN interfaces. As per the specified rules in the ACL, the traffic on the interface/ VLAN members or Port-channel members will be permitted or denied.

## clear counters mac access-group

Clear counters for all or a specific MAC ACL.

<b>Syntax</b>	<code>clear counters mac access-group [mac-list-name]</code>
<b>Parameters</b>	<b>mac-list-name</b> (OPTIONAL) Enter the name of a configured MAC access list.
<b>Command Modes</b>	EXEC Privilege
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.1.1.0	Introduced on the E-Series.

## mac access-group

Apply a MAC ACL to traffic entering or exiting an interface. The following interface types can be used for VLAN , Physical interface, Port channel interface. Enter into the interface mode and apply the mac acl in the following manner.

**Syntax** Applying MAC Access group on a physical / port channel interface  
`mac access-group access-list-name {in [vlan vlan-range] | out}`  
To delete a MAC access-group, use the `no mac access-group mac-list-name` command.

### Parameters

**access-list-name** Enter the name of a configured MAC access list, up to 140 characters.

**vlan vlan-range** (OPTIONAL) Enter the keyword `vlan` and then enter a range of VLANs. The range is from 1 to 4094 (you can use IDs 1 to 4094).

 **NOTE:** This option is available only with the keyword `in` option.

**in** Enter the keyword `in` to configure the ACL to filter incoming traffic.

**out** Enter the keyword `out` to configure the ACL to filter outgoing traffic.

 **NOTE:** The option is not available on the S-Series.

#### NOTE:

1. If the MAC ACL is applied on VLAN, none of the VLAN members should have an access list applied for that VLAN.
2. If the MAC ACL is applied on a Physical or Port Channel interface, the VLAN in which this port is associated should not have an access list applied.
3. If the MAC ACL is applied on a VLAN, then that VLAN should not belong to VLAN ACL group.
4. If the MAC ACL is applied on a VLAN ACL group, then none of the VLANs in that group should have an access list applied on it.

**Defaults** none

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.1.1.0	Introduced on the E-Series.

#### Usage Information

You can assign one ACL (standard or extended) to an interface.

#### Related Commands

[mac access-list standard](#) — configures a standard MAC ACL.

[mac access-list extended](#) — configures an extended MAC ACL.

## show mac access-lists

Display all of the Layer 2 ACLs configured in the system, whether or not they are applied to an interface, and the count of matches/mismatches against each ACL entry displayed.

**Syntax** `show mac access-lists [access-list-name] [interface interface]  
[in | out]`

#### Parameters

<b><i>access-list-name</i></b>	Enter the name of a configured MAC ACL, up to 140 characters.
<b><i>interface interface</i></b>	Enter the keyword <i>interface</i> then the one of the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li></ul>
<b><i>in</i>   <i>out</i></b>	Identify whether ACL is applied on ingress or egress side.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.5.1.0	Added support for 4-port 40G line cards on ExaScale.
8.4.1.0	Introduced.

## show mac accounting access-list

Display MAC access list configurations and counters (if configured).

**Syntax** `show mac accounting access-list access-list-name interface interface in | out`

**Parameters**

<b><i>access-list-name</i></b>	Enter the name of a configured MAC ACL, up to 140 characters.
<b><i>interface</i></b> <b><i>interface</i></b>	Enter the keyword <code>interface</code> then the one of the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>For a port channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li><li>For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li></ul>
<b>in   out</b>	Identify whether ACL is applied on ingress or egress side.

**Command Modes**

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.5.1.0	Added support for 4-port 40G line cards on ExaScale.
8.1.1.0	Introduced on the E-Series ExaScale.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.1.1.0	Introduced on the E-Series.

## Usage Information

The ACL hit counters increment the counters for each matching rule, not just the first matching rule.

## Example

```
Dell#show mac accounting access-list TestMac interface
tengigabitethernet 1/8 in
Ingress Standard mac access-list TestMac on TenGigabitEthernet
1/89
Total cam count 2
  seq 5 permit aa:aa:aa:aa:00:00 00:00:00:00:ff:ff count (0
packets)
  seq 10 deny any count (20072594 packets)
Dell#
```

## Standard MAC ACL Commands

When you create an access control list without any rule and then apply it to an interface, the ACL behavior reflects implicit permit. These commands configure standard MAC ACLs and support both Ingress and Egress MAC ACLs.

**NOTE:** For more information, also refer to the [Commands Common to all ACL Types](#) and [Common MAC Access List Commands](#) sections.

## deny

To drop packets with a the MAC address specified, configure a filter.

**Syntax** `deny {any | mac-source-address [mac-source-address-mask]} [count [byte]] [log] [monitor]`

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny {any | mac-source-address mac-source-address-mask}` command.

### Parameters

<b>any</b>	Enter the keyword <code>any</code> to specify that all routes are subject to the filter.
<b><i>mac-source-address</i></b>	Enter a MAC address in <code>nn:nn:nn:nn:nn:nn</code> format.
<b><i>mac-source-address-mask</i></b>	(OPTIONAL) Specify which bits in the MAC address must match. If no mask is specified, a mask of <code>00:00:00:00:00:00</code> is applied (in other words, the filter allows only MAC addresses that match).
<b>count</b>	(OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.
<b>byte</b>	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes processed by the filter.
<b>log</b>	(OPTIONAL, E-Series only) Enter the keyword <code>log</code> to log the packets.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, refer to the "Flow-based Monitoring" section in the Port Monitoring chapter of the <i>Dell Networking OS Configuration Guide</i> .

**Defaults** Not enabled.

**Command Modes** CONFIGURATION-MAC ACCESS LIST-STANDARD

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added the <code>monitor</code> option.

#### Usage Information

When you use the `log` option, the CP processor logs detail the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets' details.

**NOTE:** When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

#### Related Commands

[permit](#) — configures a MAC address filter to pass packets.

[seq](#) — configures a MAC address filter with a specified sequence number.

## mac access-list standard

To configure a standard MAC ACL, name a new or existing MAC access control list (MAC ACL) and enter MAC ACCESS LIST mode. Also refer to the Commands Common to all ACL Types section and the Common MAC Access List Commands section.

#### Syntax

```
mac access-list standard mac-list-name
```

To delete a MAC access list, use the `no mac access-list standard mac-list-name` command.

#### Parameters

***mac-list-name*** Enter a text string as the name of the standard MAC access list (140 character maximum).

#### Defaults

Not configured.

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.1.1.0	Introduced on the E-Series.

#### Usage Information

Dell Networking OS supports one ingress and one egress MAC ACL per interface.

The number of entries allowed per ACL is hardware-dependent. For detailed specifications about entries allowed per ACL, refer to your line card documentation.

**NOTE:** Ingress ACLs are supported on C-Series and S-Series platforms only.

#### Example

```
Dell(config)#mac-access-list access-list standard TestMAC
Dell(config-std-macl)#permit 00:00:00:00:00:00
00:00:00:00:ff:ff count
Dell(config-std-macl)#deny any count
```

## permit

To forward packets from a specific source MAC address, configure a filter.

#### Syntax

```
permit {any | mac-source-address [mac-source-address-mask]}
[count [byte]] | [log] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit {any | mac-source-address mac-source-address-mask}` command.

#### Parameters

**any** Enter the keyword `any` to forward all packets received with a MAC address.

<b>mac-source-address</b>	Enter a MAC address in nn:nn:nn:nn:nn:nn format.
<b>mac-source-address-mask</b>	(OPTIONAL) Specify which bits in the MAC address must match. If no mask is specified, a mask of 00:00:00:00:00:00 is applied (in other words, the filter allows only MAC addresses that match).
<b>count</b>	(OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.
<b>byte</b>	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes processed by the filter.
<b>log</b>	(OPTIONAL, E-Series only) Enter the keyword <code>log</code> to log the packets.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

**NOTE:** For more information, refer to the Flow-based Monitoring section in the Port Monitoring chapter of the *Dell Networking OS Configuration Guide*.

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION-MAC ACCESS LIST-STANDARD

8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.1.1.0	Introduced on the E-Series.

## Usage Information

When you use the `log` option, the CP processor logs details about the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets' details.

**NOTE:** When you configure the ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

## Related Commands

[deny](#) — configures a MAC ACL filter to drop packets.

[seq](#) —configure a MAC ACL filter with a specified sequence number.

## seq

To deny or permit filter in a MAC access list while creating the filter, assign a sequence number.

### Syntax

```
seq sequence-number {deny | permit} {any | mac-source-address [mac-source-address-mask]} [count [byte]] [log] [monitor] [no-drop]
```

To remove this filter, use the `no seq sequence-number` command.

### Parameters

<b><i>sequence-number</i></b>	Enter a number from 0 to 65535.
<b>deny</b>	Enter the keyword <code>deny</code> to configure a filter to drop packets meeting this condition.
<b>permit</b>	Enter the keyword <code>permit</code> to configure a filter to forward packets meeting this criteria.
<b>any</b>	Enter the keyword <code>any</code> to filter all packets.
<b><i>mac-source-address</i></b>	Enter a MAC address in <code>nn:nn:nn:nn:nn:nn</code> format.
<b><i>mac-source-address-mask</i></b>	(OPTIONAL) Specify which bits in the MAC address must match. If no mask is specified, a mask of <code>00:00:00:00:00:00</code> is applied (in other words, the filter allows only MAC addresses that match).
<b>count</b>	(OPTIONAL) Enter the keyword <code>count</code> to count packets the filter processes.
<b>byte</b>	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes the filter processes.
<b>log</b>	(OPTIONAL, E-Series only) Enter the keyword <code>log</code> to log the packets.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL

in which you are creating the rule is applied to the monitored interface.

**NOTE:** For more information, refer to the “Flow-based Monitoring” section in the Port Monitoring chapter of the *Dell Networking OS Configuration Guide*.

**no-drop** Enter the keywords `no-drop` to match only the forwarded packets.

**Defaults**

Not configured

**Command Modes**

CONFIGURATION-MAC ACCESS LIST-STANDARD

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.8(0.0)	Added the no-drop parameter.
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added the <code>monitor</code> option.
6.1.1.0	Introduced on the E-Series.

**Usage Information**

When you use the `log` option, the CP processor logs details about the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets' details.

**NOTE:** When you configure the ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

**Related Commands**

[deny](#) — configures a filter to drop packets.

[permit](#) — configures a filter to forward packets.

# Extended MAC ACL Commands

When an access-list is created without any rule and then applied to an interface, ACL behavior reflects implicit permit. The following commands configure Extended MAC ACLs.

The platform supports both Ingress and Egress MAC ACLs.

 **NOTE:** For more information, also refer to the [Commands Common to all ACL Types](#) and [Common MAC Access List Commands](#) sections.

## deny

To drop packets that match the filter criteria, configure a filter.

### Syntax

```
deny {any | host mac-address | mac-source-address mac-source-address-mask} {any | host mac-address | mac-destination-address mac-destination-address-mask} [ethertype-operator] [count [byte]] [log] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny {any | host mac-address | mac-source-address mac-source-address-mask} {any | host mac-address | mac-destination-address mac-destination-address-mask}` command.

### Parameters

<b>any</b>	Enter the keyword <code>any</code> to drop all packets.
<b>host mac-address</b>	Enter the keyword <code>host</code> and then enter a MAC address to drop packets with that host address.
<b>mac-source-address</b>	Enter a MAC address in <code>nn:nn:nn:nn:nn:nn</code> format.
<b>mac-source-address-mask</b>	Specify which bits in the MAC address must match.  The MAC ACL supports an inverse mask; therefore, a mask of <code>ff:ff:ff:ff:ff:ff</code> allows entries that do not match and a mask of <code>00:00:00:00:00:00</code> only allows entries that match exactly.
<b>mac-destination-address</b>	Enter the destination MAC address and mask in <code>nn:nn:nn:nn:nn:nn</code> format.
<b>mac-destination-address-mask</b>	Specify which bits in the MAC address must match.  The MAC ACL supports an inverse mask; therefore, a mask of <code>ff:ff:ff:ff:ff:ff</code> allows entries that do not match and a mask of <code>00:00:00:00:00:00</code> only allows entries that match exactly.

<b><i>ethertype operator</i></b>	(OPTIONAL) To filter based on protocol type, enter one of the following Ethertypes: <ul style="list-style-type: none"> <li>• <code>ev2</code> - is the Ethernet II frame format</li> <li>• <code>llc</code> - is the IEEE 802.3 frame format</li> <li>• <code>snap</code> - is the IEEE 802.3 SNAP frame format</li> </ul>
<b><code>count</code></b>	(OPTIONAL) Enter the keyword <code>count</code> to count packets processed by the filter.
<b><code>byte</code></b>	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes processed by the filter.
<b><code>log</code></b>	(OPTIONAL, E-Series only) Enter the keyword <code>log</code> to log the packets.
<b><code>monitor</code></b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, refer to the "Flow-based Monitoring" section in the Port Monitoring chapter of the <i>Dell Networking OS Configuration Guide</i> .

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION-MAC ACCESS LIST-EXTENDED

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

<b>Version</b>	<b>Description</b>
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.1.1.0</b>	Introduced on the E-Series ExaScale.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>7.4.1.0</b>	Added the <code>monitor</code> option.
<b>6.1.1.0</b>	Introduced on the E-Series.

## Usage Information

When you use the `log` option, the CP processor logs detail the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets' details.

**NOTE:** When you configure the ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

## Related Commands

[permit](#) — configures a MAC address filter to pass packets.

[seq](#) — configures a MAC address filter with a specified sequence number.

## mac access-list extended

Name a new or existing extended MAC access control list (extended MAC ACL).

### Syntax

```
mac access-list extended access-list-name [cpu-qos
```

To delete a MAC access list, use the `no mac access-list extended access-list-name` command.

### Parameters

***access-list-name***

Enter a text string as the MAC access list name, up to 140 characters.

***cpu-qos***

Enter the keywords `cpu-qos` to assign this ACL to control plane traffic only (CoPP).

### Defaults

none

### Command Modes

CONFIGURATION

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.10.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names were up to 16 characters long.

Version	Description
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.1.1.0	Introduced on the E-Series.

### Usage Information

The number of entries allowed per ACL is hardware-dependent. For detailed specifications about entries allowed per ACL, refer to your line card documentation.

Prior to 7.8.1.0, names are up to 16 characters long.

### Example

```
Dell(conf)#mac-access-list access-list extended TestMATExt
Dell(config-ext-macl)#remark 5 IPv4
Dell(config-ext-macl)#seq 10 permit any any ev2 eq 800 count
bytes
Dell(config-ext-macl)#remark 15 ARP
Dell(config-ext-macl)#seq 20 permit any any ev2 eq 806 count
bytes
Dell(config-ext-macl)#remark 25 IPv6
Dell(config-ext-macl)#seq 30 permit any any ev2 eq 86dd count
bytes
Dell(config-ext-macl)#seq 40 permit any any count bytes
Dell(config-ext-macl)#exit
Dell(conf)#do show mac accounting access-list snickers
interface tengig 1/17 in
Extended mac access-list snickers on TenGigabitEthernet 1/17
seq 10 permit any any ev2 eq 800 count bytes (559851886
packets 191402152148
bytes)
seq 20 permit any any ev2 eq 806 count bytes (74481486 packets
5031686754
bytes)
seq 30 permit any any ev2 eq 86dd count bytes (7751519 packets
797843521 bytes)
```

### Related Commands

[mac access-list standard](#) — configures a standard MAC access list.

[show mac accounting access-list](#) — displays MAC access list configurations and counters (if configured).

## permit

To pass packets matching the criteria specified, configure a filter.

### Syntax

```
permit {any | host mac-address | mac-source-address mac-source-
address-mask} {any | host mac-address | mac-destination-address
mac-destination-address-mask} [ethertype operator] [count
[byte]] | [log] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit {any | host mac-address | mac-source-address mac-source-address-mask} {any | mac-destination-address mac-destination-address-mask}` command.

## Parameters

<b>any</b>	Enter the keyword <code>any</code> to forward all packets.
<b>host</b>	Enter the keyword <code>host</code> then a MAC address to forward packets with that host address.
<b>mac-source-address</b>	Enter a MAC address in <code>nn:nn:nn:nn:nn:nn</code> format.
<b>mac-source-address-mask</b>	(OPTIONAL) Specify which bits in the MAC address must match.  The MAC ACL supports an inverse mask; therefore, a mask of <code>ff:ff:ff:ff:ff:ff</code> allows entries that do not match and a mask of <code>00:00:00:00:00:00</code> only allows entries that match exactly.
<b>mac-destination-address</b>	Enter the destination MAC address and mask in <code>nn:nn:nn:nn:nn:nn</code> format.
<b>mac-destination-address-mask</b>	Specify which bits in the MAC address must be matched.  The MAC ACL supports an inverse mask; therefore, a mask of <code>ff:ff:ff:ff:ff:ff</code> allows entries that do not match and a mask of <code>00:00:00:00:00:00</code> only allows entries that match exactly.
<b>ethertype operator</b>	(OPTIONAL) To filter based on protocol type, enter one of the following Ethertypes: <ul style="list-style-type: none"> <li>• <code>ev2</code> - is the Ethernet II frame format</li> <li>• <code>11c</code> - is the IEEE 802.3 frame format</li> <li>• <code>snap</code> - is the IEEE 802.3 SNAP frame format</li> </ul>
<b>count</b>	(OPTIONAL) Enter the keyword <code>count</code> to count packets the filter processes.
<b>byte</b>	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes the filter processes.
<b>log</b>	(OPTIONAL, E-Series only) Enter the keyword <code>log</code> to log the packets.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

**NOTE:** For more information, refer to the Flow-based Monitoring section in the Port Monitoring chapter of the *Dell Networking OS Configuration Guide*.

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION-MAC ACCESS LIST-EXTENDED

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added the <code>monitor</code> option.
6.1.1.0	Introduced on the E-Series.

**Usage Information**

When you use the `log` option, the CP processor logs details about the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets' details.

**NOTE:** When you configure the ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

**Related Commands**

[deny](#) — configures a MAC ACL filter to drop packets.

[seq](#) — configure a MAC ACL filter with a specified sequence number.

**seq**

Configure a filter with a specific sequence number.

**Syntax**

```
seq sequence-number {deny | permit} {any | host mac-address | mac-source-address mac-source-address-mask} {any | host mac-
```

```
address | mac-destination-address mac-destination-address-mask}
[ethertype operator] [count [byte]] [log] [monitor] [no-drop]
```

To delete a filter, use the `no seq sequence-number` command.

## Parameters

<b>sequence-number</b>	Enter a number as the filter sequence number. The range is from zero (0) to 65535.
<b>deny</b>	Enter the keyword <code>deny</code> to drop any traffic matching this filter.
<b>permit</b>	Enter the keyword <code>permit</code> to forward any traffic matching this filter.
<b>any</b>	Enter the keyword <code>any</code> to filter all packets.
<b>host mac-address</b>	Enter the keyword <code>host</code> and then enter a MAC address to filter packets with that host address.
<b>mac-source-address</b>	Enter a MAC address in <code>nn:nn:nn:nn:nn:nn</code> format. The MAC ACL supports an inverse mask; therefore, a mask of <code>ff:ff:ff:ff:ff:ff</code> allows entries that do not match and a mask of <code>00:00:00:00:00:00</code> only allows entries that match exactly.
<b>mac-source-address-mask</b>	Specify which bits in the MAC address must be matched.
<b>mac-destination-address</b>	Enter the destination MAC address and mask in <code>nn:nn:nn:nn:nn:nn</code> format.
<b>mac-destination-address-mask</b>	Specify which bits in the MAC address must be matched. The MAC ACL supports an inverse mask; therefore, a mask of <code>ff:ff:ff:ff:ff:ff</code> allows entries that do not match and a mask of <code>00:00:00:00:00:00</code> only allows entries that match exactly.
<b>ethertype operator</b>	(OPTIONAL) To filter based on protocol type, enter one of the following Ethertypes: <ul style="list-style-type: none"> <li>• <code>ev2</code> - is the Ethernet II frame format.</li> <li>• <code>llc</code> - is the IEEE 802.3 frame format.</li> <li>• <code>snap</code> - is the IEEE 802.3 SNAP frame format.</li> </ul>
<b>count</b>	(OPTIONAL) Enter the keyword <code>count</code> to count packets the filter processes.
<b>byte</b>	(OPTIONAL) Enter the keyword <code>byte</code> to count bytes the filter processes.
<b>log</b>	(OPTIONAL, E-Series only) Enter the keyword <code>log</code> to log the packets.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL

in which you are creating the rule is applied to the monitored interface.

**NOTE:** For more information, refer to the Flow-based Monitoring section in the Port Monitoring chapter of the *Dell Networking OS Configuration Guide*.

**no-drop** Enter the keywords `no-drop` to match only the forwarded packets.

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION-MAC ACCESS LIST-STANDARD

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.8(0.0)	Added the no-drop parameter.
9.0.2.0	Introduced on the S6000.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Added the <code>monitor</code> option.
pre-6.1.1.0	Introduced on the E-Series.

**Usage Information**

When you use the `log` option, the CP processor logs details about the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets' details.

**NOTE:** When ACL logging and byte counters are configured simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

**Related Commands**

[deny](#) — configures a filter to drop packets.

[permit](#) — configures a filter to forward packets.

# IP Prefix List Commands

When you create an access-list without any rule and then apply it to an interface, the ACL behavior reflects implicit permit.

To configure or enable IP prefix lists, use these commands.

## clear ip prefix-list

Reset the number of times traffic meets the conditions ("hit" counters) of the configured prefix lists.

<b>Syntax</b>	<code>clear ip prefix-list [prefix-name]</code>
<b>Parameters</b>	<b>prefix-name</b> (OPTIONAL) Enter the name of the configured prefix list to clear only counters for that prefix list, up to 140 characters long.
<b>Defaults</b>	Clears "hit" counters for all prefix lists unless a prefix list is specified.
<b>Command Modes</b>	EXEC Privilege
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.8.1.0	Increase the name string to accept up to 140 characters. Prior to 7.8.1.0, names were up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.2.1.1	Introduced on the E-Series.

**Related Commands** [ip prefix-list](#) — configures a prefix list.

## deny

To drop packets meeting the criteria specified, configure a filter.

**Syntax** `deny ip-prefix [ge min-prefix-length] [le max-prefix-length]`  
To delete a drop filter, use the `no deny ip-prefix` command.

**Parameters**

<i>ip-prefix</i>	Specify an IP prefix in the network/length format. For example, 35.0.0.0/ 8 means match the first 8 bits of address 35.0.0.0.
<i>ge min-prefix-length</i>	(OPTIONAL) Enter the keyword <i>ge</i> and then enter the minimum prefix length, which is a number from zero (0) to 32.
<i>le max-prefix-length</i>	(OPTIONAL) Enter the keyword <i>le</i> and then enter the maximum prefix length, which is a number from zero (0) to 32.

**Defaults** Not configured.

**Command Modes** PREFIX-LIST

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.1.1.0	Introduced on the E-Series.

**Usage Information** Sequence numbers for this filter are automatically assigned starting at sequence number 5.

If you do not use the `ge` or `le` options, only packets with an exact match to the prefix are filtered.

## ip prefix-list

Enter the PREFIX-LIST mode and configure a prefix list.

**Syntax** `ip prefix-list prefix-name`  
To delete a prefix list, use the `no ip prefix-list prefix-name` command.

**Parameters** ***prefix-name*** Enter a string up to 16 characters long as the name of the prefix list, up to 140 characters long.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.2.1.1	Introduced on the E-Series.

**Usage Information** Prefix lists redistribute OSPF and RIP routes meeting specific criteria.

**Related Commands** [show ip route list](#) — displays IP routes in an IP prefix list.

[show ip prefix-list summary](#) — displays a summary of the configured prefix lists.

## permit

Configure a filter that passes packets meeting the criteria specified.

**Syntax** `permit ip-prefix [ge min-prefix-length] [le max-prefix-length]`  
To delete a forward filter, use the `no permit ip-prefix` command.

### Parameters

<b><i>ip-prefix</i></b>	Specify an IP prefix in the network/length format. For example, 35.0.0.0/8 means match the first 8 bits of address 35.0.0.0.
<b><i>ge min-prefix-length</i></b>	(OPTIONAL) Enter the keyword <code>ge</code> and then enter the minimum prefix length, which is a number from zero (0) to 32.
<b><i>le max-prefix-length</i></b>	(OPTIONAL) Enter the keyword <code>le</code> and then enter the maximum prefix length, which is a number from zero (0) to 32.

**Command Modes** PREFIX-LIST

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.0.2.0	Introduced on the S6000.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-Version 6.1.1.0	Introduced on the E-Series.

**Usage Information** Sequence numbers for this filter are automatically assigned starting at sequence number 5.

If you do not use the `ge` or `le` options, only packets with an exact match to the prefix are filtered.

**Related Commands** [deny](#) — configures a filter to drop packets.

[seq](#) — configures a drop or permit filter with a specified sequence number.

## seq

To a deny or permit filter in a prefix list while configuring the filter, assign a sequence number.

### Syntax

```
seq sequence-number {deny | permit} {any} | [ip-prefix /nn {ge min-prefix-length} {le max-prefix-length}] | [bitmask number]
```

To delete a specific filter, use the `no seq sequence-number {deny | permit} {any} | [ip-prefix {ge min-prefix-length} {le max-prefix-length}] | [bitmask number]`.

### Parameters

<b><i>sequence-number</i></b>	Enter a number. The range is from 1 to 4294967294.
<b>deny</b>	Enter the keyword <code>deny</code> to configure a filter to drop packets meeting this condition..
<b>permit</b>	Enter the keyword <code>permit</code> to configure a filter to forward packets meeting this condition.
<b>any</b>	(OPTIONAL) Enter the keyword <code>any</code> to match any packets.
<b><i>ip-prefix /nn</i></b>	(OPTIONAL) Specify an IP prefix in the network/length format. For example, <code>35.0.0.0/8</code> means match the first 8 bits of address <code>35.0.0.0</code> .
<b><i>ge min-prefix-length</i></b>	(OPTIONAL) Enter the keyword <code>ge</code> and then enter the minimum prefix length, which is a number from zero (0) to 32.
<b><i>le max-prefix-length</i></b>	(OPTIONAL) Enter the keyword <code>le</code> and then enter the maximum prefix length, which is a number from zero (0) to 32.
<b><i>bitmask number</i></b>	Enter the keyword <code>bitmask</code> then enter a bit mask number in dotted decimal format.

### Defaults

Not configured.

7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.1.1.0	Introduced on the E-Series.

**Example**

```
Dell (conf-nprefix1) #show config
!
```

```
ip prefix-list snickers
Dell(conf-nprefix1)#
```

## show ip prefix-list detail

Display details of the configured prefix lists.

<b>Syntax</b>	<code>show ip prefix-list detail [<i>prefix-name</i>]</code>	
<b>Parameters</b>	<b><i>prefix-name</i></b>	(OPTIONAL) Enter a text string as the name of the prefix list, up to 140 characters.
<b>Command Modes</b>	<ul style="list-style-type: none"><li>EXEC</li><li>EXEC Privilege</li></ul>	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .	

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.1.1.0	Introduced on the E-Series.

**Example**

```
Dell#show ip prefix-list detail
Ip Prefix-list with the last deletion/insertion: PL_OSPF_to_RIP
ip prefix-list PL_OSPF_to_RIP:
count: 3, range entries: 1, sequences: 5 - 25
  seq 5 permit 1.1.1.0/24 (hit count: 0)
  seq 10 deny 2.1.0.0/16 ge 23 (hit count: 0)
  seq 25 permit 192.0.0.0 bitmask 192.0.0.0 (hit count: 800)
```

## show ip prefix-list summary

Display a summary of the configured prefix lists.

**Syntax** `show ip prefix-list summary [prefix-name]`

**Parameters**

<b><i>prefix-name</i></b>	(OPTIONAL) Enter a text string as the name of the prefix list, up to 140 characters.
---------------------------	--

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.

# Route Map Commands

When you create an access-list without any rule and then applied to an interface, the ACL behavior reflects implicit permit.

To configure route maps and their redistribution criteria, use the following commands.

## continue

To a route-map entry with a higher sequence number, configure a route-map.

**Syntax** `continue [sequence-number]`

**Parameters**

<b>sequence-number</b>	(OPTIONAL) Enter the route map sequence number. The range is from 1 to 65535.
------------------------	---

**Defaults** Not configured.

**Command Modes** ROUTE-MAP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Introduced on the E-Series.

**Usage Information** The `continue` feature allows movement from one route-map entry to a specific route-map entry (the sequence number). If you do not specify the sequence number, the `continue` feature simply moves to the next sequence number (also known as an implied continue). If a match clause exists, the `continue` feature executes only after a successful match occurs. If there are no successful matches, the `continue` feature is ignored.

### Match clause with Continue clause

The `continue` feature can exist without a match clause. A continue clause without a match clause executes and jumps to the specified route-map entry.

With a match clause and a continue clause, the match clause executes first and the continue clause next in a specified route map entry. The continue clause launches only after a successful match. The behavior is:

- A successful match with a continue clause, the route map executes the set clauses and then goes to the specified route map entry upon execution of the continue clause.
- If the next route map entry contains a continue clause, the route map executes the continue clause if a successful match occurs.
- If the next route map entry does not contain a continue clause, the route map evaluates normally. If a match does not occur, the route map does not continue and falls through to the next sequence number, if one exists.

### Set Clause with Continue Clause

If the route-map entry contains sets with the continue clause, set actions are performed first then the continue clause jumps to the specified route map entry.

- If a set action occurs in the first route map entry and then the same set action occurs with a different value in a subsequent route map entry, the last set of actions overrides the previous set of actions with the same `set` command.
- If `set community additive` and `set as-path prepend` are configured, the communities and AS numbers are prepended.

#### Related Commands

[set community](#) — specifies a COMMUNITY attribute.

[set as-path](#) — configures a filter to modify the AS path.

## description

Add a description to this route map.

#### Syntax

```
description {description}
```

To remove the description, use the `no description {description}` command.

#### Parameters

***description*** Enter a description to identify the route map (80 characters maximum).

#### Defaults

none

#### Command Modes

ROUTE-MAP

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
pre-7.7.1.0	Introduced.

**Related Commands**      [route-map](#) — enables a route map.

## match as-path

To match routes that have a certain AS number in their BGP path, configure a filter.

**Syntax**                    `match as-path as-path-name`  
 To delete a match AS path filter, use the `no match as-path as-path-name` command.

**Parameters**                ***as-path-name***            Enter the name of an established AS-PATH ACL, up to 140 characters.

**Defaults**                    Not configured.

**Command Modes**            ROUTE-MAP

**Command History**            This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.

Version	Description
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

**Related Commands**      [set as-path](#) — adds information to the BGP AS\_PATH attribute.

## match community

To match routes that have a certain COMMUNITY attribute in their BGP path, configure a filter.

**Syntax**                    `match community community-list-name [exact]`  
 To delete a community match filter, use the `no match community` command.

**Parameters**

<b><i>community-list-name</i></b>	Enter the name of a configured community list.
<b>exact</b>	(OPTIONAL) Enter the keywords <code>exact</code> to process only those routes with this community list name.

**Defaults**                    Not configured.

**Command Modes**            ROUTE-MAP

**Command History**            This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

**Related  
Commands**

[set community](#) — specifies a COMMUNITY attribute.

## match interface

To match routes whose next hop is on the interface specified, configure a filter.

**Syntax**

```
match interface interface
```

To remove a match, use the `no match interface interface` command.

**Parameters**

***interface***

Enter the following keywords and slot/port or number information:

- .
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults**

Not configured.

**Command  
Modes**

ROUTE-MAP

**Command  
History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.5.1.0	Added support for 4-port 40G line cards on ExaScale.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.

Version	Description
7.5.1.0	Introduced on the C-Series.
6.1.1.0	Introduced on the E-Series.

#### Related Commands

[match ip address](#) — redistributes routes that match an IP address.

[match ip next-hop](#) — redistributes routes that match the next-hop IP address.

[match ip route-source](#) — redistributes routes that match routes advertised by other routers.

[match metric](#) — redistributes routes that match a specific metric.

[match route-type](#) — redistributes routes that match a route type.

[match tag](#) — redistributes routes that match a specific tag.

## match ip address

To match routes based on IP addresses specified in an access list, configure a filter.

#### Syntax

`match ip address prefix-list-name`

To delete a match, use the `no match ip address prefix-list-name` command.

#### Parameters

***prefix-list-name*** Enter the name of configured prefix list, up to 140 characters.

#### Defaults

Not configured.

#### Command Modes

ROUTE-MAP

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.

Version	Description
8.1.1.0	Introduced on the E-Series ExaScale.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

**Related  
Commands**

- [match interface](#) – redistributes routes that match the next-hop interface.
- [match ip next-hop](#) – redistributes routes that match the next-hop IP address.
- [match ip route-source](#) – redistributes routes that match routes advertised by other routers.
- [match metric](#) – redistributes routes that match a specific metric.
- [match route-type](#) – redistributes routes that match a route type.
- [match tag](#) – redistributes routes that match a specific tag.

## match ip next-hop

To match based on the next-hop IP addresses specified in an IP access list or IP prefix list, configure a filter.

**Syntax** `match ip next-hop {prefix-list prefix-list-name}`  
 To delete a match, use the `no match ip next-hop {prefix-list prefix-list-name}` command.

**Parameters**

<b>prefix-list</b> <b><i>prefix-list-name</i></b>	Enter the keywords <code>prefix-list</code> and then enter the name of configured prefix list, up to 140 characters.
--	--

**Defaults** Not configured.

**Command Modes** ROUTE-MAP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

#### Related Commands

- [match interface](#) — redistributes routes that match the next-hop interface.
- [match ip address](#) — redistributes routes that match an IP address.
- [match ip route-source](#) — redistributes routes that match routes advertised by other routers.
- [match metric](#) — redistributes routes that match a specific metric.
- [match route-type](#) — redistributes routes that match a route type.
- [match tag](#) — redistributes routes that match a specific tag.

## match ip route-source

To match based on the routes advertised by routes specified in IP access lists or IP prefix lists, configure a filter.

#### Syntax

```
match ip route-source {prefix-list prefix-list-name}
```

To delete a match, use the `no match ip route-source {prefix-list prefix-list-name}` command.

#### Parameters

<b>prefix-list</b> <b><i>prefix-list-name</i></b>	Enter the keywords <code>prefix-list</code> and then enter the name of configured prefix list, up to 140 characters.
--	--

#### Defaults

Not configured.

#### Command Modes

ROUTE-MAP

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810
8.1.1.0	Introduced on the E-Series ExaScale.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names were up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

## Related Commands

[match interface](#) — redistributes routes that match the next-hop interface.

[match ip address](#) — redistributes routes that match an IP address.

[match ip next-hop](#) — redistributes routes that match the next-hop IP address.

[match metric](#) — redistributes routes that match a specific metric.

[match route-type](#) — redistributes routes that match a route type.

[match tag](#) — redistributes routes that match a specific tag.

## match metric

To match on a specified value, configure a filter.

### Syntax

```
match metric metric-value
```

To delete a value, use the `no match metric [metric-value]` command.

### Parameters

***metric-value*** Enter a value to match. The range is from zero (0) to 4294967295.

### Defaults

Not configured.

**Command Modes** ROUTE-MAP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

**Related Commands**

[match interface](#) — redistributes routes that match the next-hop interface.

[match ip address](#) — redistributes routes that match an IP address.

[match ip next-hop](#) — redistributes routes that match the next-hop IP address.

[match ip route-source](#) — redistributes routes that match routes advertised by other routers.

[match route-type](#) — redistributes routes that match a route type.

[match tag](#) — redistributes routes that match a specific tag.

## match origin

To match routes based on the value found in the BGP path ORIGIN attribute, configure a filter.

**Syntax** `match origin {egp | igp | incomplete}`

To disable matching filter, use the `no match origin {igp | egp | incomplete}` command.

**Parameters**

**egp** Enter the keyword `egp` to match routes originating outside the AS.

**igp** Enter the keyword `igp` to match routes originating within the same AS.

	<b>incomplete</b>	Enter the keyword <code>incomplete</code> to match routes with incomplete routing information.
<b>Defaults</b>	Not configured.	
<b>Command Modes</b>	ROUTE-MAP	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .	

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
pre-6.1.1.0	Introduced on the E-Series.

## match route-type

To match routes based on the how the route is defined, configure a filter.

<b>Syntax</b>	<pre>match route-type {external [type-1   type-2]   internal   level-1   level-2   local}</pre> <p>To delete a match, use the <code>no match route-type {local   internal   external [type-1   type-2]   level-1   level-2}</code> command.</p>
---------------	---

<b>Parameters</b>	<p><b>external [type-1  type-2]</b> Enter the keyword <code>external</code> then either <code>type-1</code> or <code>type-2</code> to match only on OSPF Type 1 routes or OSPF Type 2 routes.</p> <p><b>internal</b> Enter the keyword <code>internal</code> to match only on routes generated within OSPF areas.</p> <p><b>level-1</b> Enter the keyword <code>level-1</code> to match IS-IS Level 1 routes.</p> <p><b>level-2</b> Enter the keyword <code>level-2</code> to match IS-IS Level 2 routes.</p> <p><b>local</b> Enter the keyword <code>local</code> to match only on routes generated within the switch.</p>
-------------------	---

<b>Defaults</b>	Not configured.
-----------------	-----------------

**Command Modes** ROUTE-MAP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

**Related Commands**

[match interface](#) – redistributes routes that match the next-hop interface.

[match ip address](#) – redistributes routes that match an IP address.

[match ip next-hop](#) – redistributes routes that match the next-hop IP address.

[match ip route-source](#) – redistributes routes that match routes advertised by other routers.

[match metric](#) – redistributes routes that match a specific metric.

[match tag](#) – redistributes routes that match a specific tag.

## match tag

To redistribute only routes that match a specified tag value, configure a filter.

**Syntax** `match tag tag-value`

To remove a match, use the `no match tag` command.

**Parameters** **tag-value** Enter a value as the tag on which to match. The range is from zero (0) to 4294967295.

**Defaults** Not configured.

**Command Modes** ROUTE-MAP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

**Related Commands**

[match interface](#) — redistributes routes that match the next-hop interface.

[match ip address](#) — redistributes routes that match an IP address.

[match ip next-hop](#) — redistributes routes that match the next-hop IP address.

[match ip route-source](#) — redistributes routes that match routes advertised by other routers.

[match metric](#) — redistributes routes that match a specific metric.

[match route-type](#) — redistributes routes that match a route type.

## route-map

Enable a route map statement and configure its action and sequence number. This command also places you in ROUTE-MAP mode.

**Syntax** `route-map map-name [permit | deny] [sequence-number]`

To delete a route map, use the `no route-map map-name [permit | deny] [sequence-number]` command.

**Parameters**

**map-name** Enter a text string of up to 140 characters to name the route map for easy identification.

<b>permit</b>	(OPTIONAL) Enter the keyword <code>permit</code> to set the route map default as <code>permit</code> . If you do not specify a keyword, the default is <code>permit</code> .
<b>deny</b>	(OPTIONAL) Enter the keyword <code>deny</code> to set the route map default as <code>deny</code> .
<b><i>sequence-number</i></b>	(OPTIONAL) Enter a number to identify the route map for editing and sequencing with other route maps. You are prompted for a sequence number if there are multiple instances of the route map. The range is from 1 to 65535.

**Defaults** Not configured.  
If you do not define a keyword (`permit` or `deny`) for the route map, the `permit` action is the default.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
<b>9.7(0.0)</b>	Introduced on the S6000–ON.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.1.1.0</b>	Introduced on the E-Series ExaScale.
<b>7.8.1.0</b>	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>pre-6.1.1.0</b>	Introduced on the E-Series.

**Usage Information** Use caution when you delete route maps because if you do not specify a sequence number, all route maps with the same `map-name` are deleted when you use the `no route-map map-name` command.

**Example**  

```
Dell(conf)#route-map dempsey
Dell(config-route-map)#
```

**Related Commands** [show config](#) — displays the current configuration.

## set as-path

To modify the AS path for border gateway protocol (BGP) routes, configure a filter.

**Syntax** `set as-path prepend as-number [... as-number]`  
To remove an AS-Path setting, use the `no set as-path {prepend as-number | tag}` command.

**Parameters**

<b>prepend as-number</b>	Enter the keyword <code>prepend</code> and then enter up to eight AS numbers to be inserted into the BGP path information. The range is from 1 to 65535.
--------------------------	--

**Defaults** Not configured.

**Command Modes** ROUTE-MAP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

**Usage Information** You can prepend up to eight AS numbers to a BGP route.

This command influences best path selection in BGP by inserting a tag or AS number into the AS\_PATH attribute.

**Related Commands** [match as-path](#) — redistributes routes that match an AS-PATH attribute.

## set automatic-tag

To automatically compute the tag value of the route, configure a filter.

**Syntax**                    `set automatic-tag`  
To return to the default, enter `no set automatic-tag`.

**Defaults**                 Not configured.

**Command Modes**         ROUTE-MAP

**Command History**       This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

**Related Commands**       [set level](#) — specify the OSPF area for route redistribution.

[set metric](#) — specify the metric value assigned to redistributed routes.

[set metric-type](#) — specify the metric type assigned to redistributed routes.

[set tag](#) — specify the tag assigned to redistributed routes.

## set comm-list delete

To remove the specified community list from the BGP route's COMMUNITY attribute, configure a filter.

**Syntax**                    `set comm-list community-list-name delete`

To insert the community list into the COMMUNITY attribute, use the `no set comm-list community-list-name delete` command.

<b>Parameters</b>	<b><i>community-list-name</i></b>	Enter the name of an established Community list, up to 140 characters.
<b>Defaults</b>	Not configured.	
<b>Command Modes</b>	ROUTE-MAP	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .	

The following is a list of the Dell Networking OS version history for this command.

<b>Version</b>	<b>Description</b>
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.1.1.0</b>	Introduced on the E-Series ExaScale.
<b>7.8.1.0</b>	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.
<b>pre-6.1.1.0</b>	Introduced on the E-Series.

**Usage Information**

The community list used in the `set comm-list delete` command must be configured so that each filter contains only one community. For example, the filter `deny 100:12` is acceptable, but the filter `deny 120:13 140:33` results in an error.

If the `set comm-list delete` command and the `set community` command are configured in the same route map sequence, the deletion command (`set comm-list delete`) is processed before the insertion command (`set community`).

**Related Commands**

- [match community](#) — redistributes routes that match the COMMUNITY attribute.
- [set community](#) — specifies a COMMUNITY attribute.

## set community

Allows you to assign a BGP COMMUNITY attribute.

**Syntax**                    `set community {community-number | local-as | no-advertise | no-export | none} [additive]`  
To delete a BGP COMMUNITY attribute assignment, use the `no set community {community-number | local-as | no-advertise | no-export | none}` command.

<b>Parameters</b>	<b>community-number</b>	Enter the community number in AA:NN format where AA is the AS number (2 bytes) and NN is a value specific to that autonomous system.
	<b>local-AS</b>	Enter the keywords <code>local-AS</code> to drop all routes with the COMMUNITY attribute of NO_EXPORT_SUBCONFED. All routes with the NO_EXPORT_SUBCONFED (0xFFFFFFFF03) community attribute must not be advertised to external BGP peers.
	<b>no-advertise</b>	Enter the keywords <code>no-advertise</code> to drop all routes containing the well-known community attribute of NO_ADVERTISE. All routes with the NO_ADVERTISE (0xFFFFFFFF02) community attribute must not be advertised to other BGP peers.
	<b>no-export</b>	Enter the keywords <code>no-export</code> to drop all routes containing the well-known community attribute of NO_EXPORT. All routes with the NO_EXPORT (0xFFFFFFFF01) community attribute must not be advertised outside a BGP confederation boundary.
	<b>none</b>	Enter the keyword <code>none</code> to remove the community attribute from routes meeting the route map criteria.
	<b>additive</b>	(OPTIONAL) Enter the keyword <code>additive</code> to add the communities to already existing communities.

**Defaults**                    Not configured.

**Command**                    ROUTE-MAP

**Modes**

**Command History**            This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

**Related  
Commands**

[match community](#) — redistributes routes that match the COMMUNITY attribute.  
[show ip bgp community](#) — displays BGP community groups.

## set level

To specify the IS-IS level or OSPF area to which matched routes are redistributed, configure a filter.

**Syntax**

```
set level {backbone | level-1 | level-1-2 | level-2 | stub-  
area}
```

To remove a set level condition, use the `no set level {backbone | level-1 | level-1-2 | level-2 | stub-area} command`.

**Parameters**

<b>backbone</b>	Enter the keyword <code>backbone</code> to redistribute matched routes to the OSPF backbone area (area 0.0.0.0).
<b>level-1</b>	Enter the keyword <code>level-1</code> to redistribute matched routes to IS-IS Level 1.
<b>level-1-2</b>	Enter the keyword <code>level-1-2</code> to redistribute matched routes to IS-IS Level 1 and Level 2.
<b>level-2</b>	Enter the keyword <code>level-2</code> to redistribute matched routes to IS-IS Level 2.
<b>stub-area</b>	Enter the keyword <code>stub</code> to redistributed matched routes to OSPF stub areas.

**Defaults**

Not configured.

**Command  
Modes**

ROUTE-MAP

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Dell Networking OS Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

## Related Commands

[set automatic-tag](#) — computes the tag value of the route.

[set metric](#) — specifies the metric value assigned to redistributed routes.

[set metric-type](#) — specifies the metric type assigned to redistributed routes.

[set tag](#) — specifies the tag assigned to redistributed routes.

## set local-preference

To set the BGP LOCAL\_PREF attribute for routers within the local autonomous system, configure a filter.

### Syntax

```
set local-preference value
```

To delete a BGP LOCAL\_PREF attribute, use the `no set local-preference` command.

### Parameters

**value** Enter a number as the LOCAL\_PREF attribute value. The range is from 0 to 4294967295.

### Defaults

Not configured.

### Command Modes

ROUTE-MAP

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

**Usage Information** The `set local-preference` command changes the LOCAL\_PREF attribute for routes meeting the route map criteria. To change the LOCAL\_PREF for all routes, use the `bgp default local-preference` command.

**Related Commands** [bgp default local-preference](#) – changes the default LOCAL\_PREF attribute for all routes.

## set metric

To assign a new metric to redistributed routes, configure a filter.

**Syntax** `set metric [+ | -] metric-value`  
 To delete a setting, enter `no set metric`.

**Parameters**

<b>+</b>	(OPTIONAL) Enter + to add a metric-value to the redistributed routes.
<b>-</b>	(OPTIONAL) Enter - to subtract a metric-value from the redistributed routes.
<b>metric-value</b>	Enter a number as the new metric value. The range is from zero (0) to 4294967295.

**Defaults** Not configured.

**Command Modes** ROUTE-MAP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

#### Related Commands

- [set automatic-tag](#) — computes the tag value of the route.
- [set level](#) — specifies the OSPF area for route redistribution.
- [set metric-type](#) — specifies the route type assigned to redistributed routes.
- [set tag](#) — specifies the tag assigned to redistributed routes.

## set metric-type

To assign a new route type for routes redistributed to OSPF, configure a filter.

**Syntax** `set metric-type {internal | external | type-1 | type-2}`  
 To delete a setting, use the `no set metric-type` command.

#### Parameters

<b>internal</b>	Enter the keyword <code>internal</code> to assign the Interior Gateway Protocol metric of the next hop as the route's BGP MULTI_EXIT_DES (MED) value.
<b>external</b>	Enter the keyword <code>external</code> to assign the IS-IS external metric.
<b>type-1</b>	Enter the keyword <code>type-1</code> to assign the OSPF Type 1 metric.
<b>type-2</b>	Enter the keyword <code>type-2</code> to assign the OSPF Type 2 metric.

**Defaults** Not configured.

**Command Modes** ROUTE-MAP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Implemented the keyword <code>internal</code> .
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

**Related  
Commands**

- [set automatic-tag](#) — computes the tag value of the route.
- [set level](#) — specifies the OSPF area for route redistribution.
- [set metric](#) — specifies the metric value assigned to redistributed routes.
- [set tag](#) — specifies the tag assigned to redistributed routes.

## set next-hop

To specify an IP address as the next hop, configure a filter.

**Syntax**

`set next-hop ip-address`

To delete the setting, use the `no set next-hop ip-address` command.

**Parameters**

***ip-address*** Specify an IP address in dotted decimal format.

**Defaults**

Not configured.

**Command  
Modes**

ROUTE-MAP

**Command  
History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

**Usage Information**

If you configure the `set next-hop` command, its configuration takes precedence over the `neighbor next-hop-self` command in the ROUTER BGP mode.

If you configure the `set next-hop` command with the interface's IP address (either Loopback or physical), the software declares the route unreachable.

**Related Commands**

[match ip next-hop](#) — redistributes routes that match the next-hop IP address.

## set origin

To manipulate the BGP ORIGIN attribute, configure a filter.

**Syntax**

```
set origin {igp | egp | incomplete}
```

To delete an ORIGIN attribute setting, use the `no set origin` command.

**Parameters**

- egp** Enter the keyword `egp` to set routes originating from outside the local AS.
- igp** Enter the keyword `igp` to set routes originating within the same AS.
- incomplete** Enter the keyword `incomplete` to set routes with incomplete routing information.

**Defaults**

Not configured.

**Command Modes**

ROUTE-MAP

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

## set tag

To specify a tag for redistributed routes, configure a filter.

**Syntax** `set tag tag-value`  
 To delete a setting, use the `no set tag` command.

**Parameters** `tag-value` Enter a number as the tag. The range is from zero (0) to 4294967295.

**Defaults** Not configured.

**Command Modes** ROUTE-MAP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

Version	Description
pre-6.1.1.0	Introduced on the E-Series.

**Related Commands**

- [set automatic-tag](#) — computes the tag value of the route.
- [set level](#) — specifies the OSPF area for route redistribution.
- [set metric](#) — specifies the metric value assigned to redistributed routes.
- [set metric-type](#) — specifies the route type assigned to redistributed routes.

## set weight

To add a non-RFC compliant attribute to the BGP route to assist with route selection, configure a filter.

**Syntax** `set weight weight`  
 To delete a weight specification, use the `no set weight weight` command.

**Parameters**

**weight** Enter a number as the weight used by the route meeting the route map specification. The range is from 0 to 65535. The default is router-originated = **32768** and all other routes = **0**. When there are multiple routes to the same destination, the routes with a higher weight are preferred.

**Defaults** router-originated = **32768**; all other routes = **0**

**Defaults** Not configured.

**Command Modes** ROUTE-MAP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.

Version	Description
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

**Usage Information** If you do not use the `set weight` command, router-originated paths have a weight attribute of 32768 and all other paths have a weight attribute of zero.

## show config

Display the current route map configuration.

**Syntax** `show config`

**Command Modes** ROUTE-MAP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

**Example**

```
Dell(conf-nprefix1)#show config
!
ip prefix-list PL_OSPF_to_RIP
 seq 5 permit 1.1.1.0/24
 seq 10 deny 2.1.0.0/16 ge 23
 seq 25 permit 192.0.0.0 bitmask 192.0.0.0
```

## show route-map

Display the current route map configurations.

**Syntax** `show route-map [map-name]`

**Parameters**

<b>map-name</b>	(OPTIONAL) Enter the name of a configured route map, up to 140 characters.
-----------------	--

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
pre-6.1.1.0	Introduced on the E-Series.

**Example**

```
Dell#show route-map
route-map firpo, permit, sequence 10
  Match clauses:
  Set clauses:
    tag 34
Dell#
```

**Related Commands** [route-map](#) — configures a route map.

# AS-Path Commands

The following commands configure AS-Path ACLs.

## ip as-path access-list

Enter AS-PATH ACL mode and configure an access control list based on the BGP AS\_PATH attribute.

**Syntax** `ip as-path access-list as-path-name`

**Parameters** `as-path-name` Enter the access-list name, up to 140 characters.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
pre-Version 6.1.1.0	Introduced on the E-Series.

**Usage Information** To apply the AS-PATH ACL to BGP routes, use the `match as-path` or `neighbor filter-list` commands.

**Example**  
Dell(conf)#ip as-path access-list TestPath  
Dell(config-as-path)#

**Related Commands** [match as-path](#) — matches on routes contain a specific AS-PATH.

## show ip as-path-access-lists

Display the all AS-PATH access lists configured on the E-Series.

**Syntax** `show ip as-path-access-lists`

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
pre-Version 6.1.1.0	Introduced on the E-Series.

**Example**

```
Dell#show ip as-path-access-lists
ip as-path access-list acc
  permit 750
  deny 10
```

## IP Community List Commands

IP community list commands are supported on the Dell Networking OS.

### ip community-list

Enter COMMUNITY-LIST mode and create an IP community-list for BGP.

**Syntax** `ip community-list comm-list-name`

To delete a community-list, use the `no ip community-list comm-list-name` command.

**Parameters**

<b><i>comm-list-name</i></b>	Enter a text string as the name of the community-list, up to 140 characters.
------------------------------	--

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
pre-Version 6.1.1.0	Introduced on the E-Series.

**Example**

```
Dell(conf)#ip community-list TestComList
Dell(config-community-list)#
```

## show ip community-lists

Display configured IP community lists in alphabetic order.

**Syntax**

```
show ip community-lists [name]
```

**Parameters**

<b><i>name</i></b>	(OPTIONAL) Enter the name of the standard or extended IP community list, up to 140 characters.
--------------------	--

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.

Version	Description
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.8.1.0	Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
pre-Version 6.1.1.0	Introduced on the E-Series.

#### Example

```
Dell#show ip community-lists
ip community-list ABC
  permit local-AS
  deny no-advertise
  permit no-export
Dell#
```

## deny (for Standard IP ACLs)

To drop packets with a certain IP address, configure a filter.

#### Syntax

```
deny {source | any | host {ip-address}}[count [byte]] [dscp
value] [order] [fragments] [log [interval minutes] [threshold-
in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny {source [mask] | any | host ip-address}` command.

#### Parameters

<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
<b>threshold-in msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
<b>interval minutes</b>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

**Defaults** By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

**Command Modes** CONFIGURATION-STANDARD-ACCESS-LIST

<b>Command History</b>	<b>Version</b>	<b>Description</b>
	<b>9.7(0.0)</b>	Introduced on the S6000–ON.
	<b>9.3(0.0)</b>	Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.
	<b>9.4(0.0)</b>	Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.

**Usage Information** When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based `enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

**Related Commands** [ip access-list standard](#) — configures a standard ACL.

[permit](#) — configures a permit filter.

## deny (for Extended IP ACLs)

Configure a filter that drops IP packets meeting the filter criteria.

**Syntax** `deny {ip | ip-protocol-number} {source mask | any | host ip-address} {destination mask | any | host ip-address} [count [byte]] [dscp value] [order] [monitor] [fragments] [log [interval minutes] [threshold-in-msgs [count]] [monitor]`

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny {ip | ip-protocol-number} {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

### Parameters

<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
<b>threshold-in-msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
<b>interval minutes</b>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

### Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

### Command Modes

CONFIGURATION-EXTENDED-ACCESS-LIST

### Command History

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.4(0.0)	Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.
9.3(0.0)	Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

## Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## Related Commands

[deny tcp](#) — Assigns a filter to deny TCP packets.

[deny udp](#) — Assigns a filter to deny UDP packets.

[ip access-list extended](#) — Creates an extended ACL.

## seq (for Standard IPv4 ACLs)

Assign a sequence number to a deny or permit filter in an IP access list while creating the filter.

### Syntax

```
seq sequence-number {deny | permit} {source [mask] | any | host ip-address}} [count [bytes]] [dscp value] [order] [fragments]  
[log [interval minutes] [threshold-in-msgs [count]] [monitor]
```

To delete a filter, use the `no seq sequence-number` command.

### Parameters

**log** (OPTIONAL) Enter the keyword `log` to enable the triggering of ACL log messages.

**threshold-in-msgs *count*** (OPTIONAL) Enter the `threshold-in-msgs` keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation

of ACL logs is terminated with the `seq`, `permit`, or `deny` commands. The threshold range is from 1 to 100.

<b>interval</b> <i>minutes</i>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

**Defaults** By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

#### Related Commands

[deny](#) — Configures a filter to drop packets.

[permit](#) — Configures a filter to forward packets.

## deny tcp (for Extended IP ACLs)

Configure a filter that drops transmission control protocol (TCP) packets meeting the filter criteria.

#### Syntax

```
deny tcp {source mask | any | host ip-address} [bit] [operator port [port]] {destination mask | any | host ip-address} [dscp] [bit] [operator port [port]] [count [byte]] [order] [fragments] [log [interval minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny tcp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

#### Parameters

<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
<b>threshold-in-msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
<b>interval minutes</b>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

#### Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

**Related Commands** [deny](#) — assigns a filter to deny IP traffic.

[deny udp](#) — assigns a filter to deny UDP traffic.

## deny udp (for Extended IP ACLs)

To drop user datagram protocol (UDP) packets meeting the filter criteria, configure a filter.

**Syntax** `deny udp {source mask | any | host ip-address} [operator port [port]] {destination mask | any | host ip-address} [dscp]`

```
[operator port [port]] [count [byte]] [order] [fragments] [log  
[interval minutes] [threshold-in-msgs [count]]]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny udp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

## Parameters

<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
<b>threshold-in msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
<b>interval minutes</b>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.

By default, 10 ACL logs are generated if you do not specify the threshold explicitly. The default frequency at which ACL logs are generated is five minutes.

## Command Modes

CONFIGURATION-EXTENDED-ACCESS-LIST

## Command History

**Version 9.3(0.0)** Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

## Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

## Related Commands

[deny](#) — assigns a filter to deny IP traffic.

[deny tcp](#) — assigns a filter to deny TCP traffic.

## deny arp (for Extended MAC ACLs)

Configure an egress filter that drops ARP packets on egress ACL supported line cards. (For more information, refer to your line card documentation).

**Syntax**                    `deny arp {destination-mac-address mac-address-mask | any} vlan  
vlan-id {ip-address | any | opcode code-number} [count [byte]]  
[order] [log [interval minutes] [threshold-in-msgs [count]]  
[monitor]`

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny arp {destination-mac-address mac-address-mask | any} vlan vlan-id {ip-address | any | opcode code-number}` command.

### Parameters

<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
<b>threshold-in msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
<b>interval minutes</b>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

### Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## deny icmp (for Extended IP ACLs)

To drop all or specific internet control message protocol (ICMP) messages, configure a filter.

 **NOTE:** Only the options that have been newly introduced in Release 9.3(0.0) and Release 9.4(0.0) are described here. For a complete description on all of the keywords and variables that are available with this command, refer the topic of this command discussed earlier in this guide.

### Syntax

```
deny icmp {source mask | any | host ip-address} {destination
mask | any | host ip-address} [dscp] [message-type] [count
[byte]] [order] [fragments] [log [interval minutes] [threshold-
in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.

- Use the `no deny icmp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

## Parameters

<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
<b>threshold-in msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
<b>interval minutes</b>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

## Defaults

<b>Version 9.4(0.0)</b>	Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.

## Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based `enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by

monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## deny ether-type (for Extended MAC ACLs)

Configure an egress filter that drops specified types of Ethernet packets on egress ACL supported line cards. (For more information, refer to your line card documentation).

### Syntax

```
deny ether-type protocol-type-number {destination-mac-address mac-address-mask | any} vlan vlan-id {source-mac-address mac-address-mask | any} [count [byte]] [order] [log [interval minutes] [threshold-in-msgs [count]]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny ether-type protocol-type-number {destination-mac-address mac-address-mask | any} vlan vlan-id {source-mac-address mac-address-mask | any}` command.

### Parameters

<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
<b>threshold-in msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
<b>interval minutes</b>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

### Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

**Related  
Commands**

[permit](#) — configures a MAC address filter to pass packets.

[seq](#) — configures a MAC address filter with a specified sequence number.

## deny (for Extended MAC ACLs)

To drop packets that match the filter criteria, configure a filter.

**Syntax**

```
deny {any | host mac-address | mac-source-address mac-source-
address-mask} {any | host mac-address | mac-destination-address
mac-destination-address-mask} [ethertype-operator] [count
[byte]][log [interval minutes] [threshold-in-msgs [count]]
[monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no deny {any | host mac-address | mac-source-address mac-source-address-mask} {any | host mac-address | mac-destination-address mac-destination-address-mask}` command.

**Parameters**

<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
<b>threshold-in msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
<b>interval minutes</b>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.

**monitor** (OPTIONAL) Enter the keyword `monitor` when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

**Defaults** By default, 10 ACL logs are generated if you do not specify the threshold explicitly.  
The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based `enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

**Related Commands** [permit](#) — configures a MAC address filter to pass packets.

[seq](#) — configures a MAC address filter with a specified sequence number.

## permit (for Standard IP ACLs)

To permit packets from a specific source IP address to leave the switch, configure a filter.

**Syntax**                    `permit {source [mask] | any | host ip-address} [count [byte]]  
[dscp value] [order] [fragments] [log [interval minutes]  
[threshold-in-msgs [count]] [monitor]`

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit {source [mask] | any | host ip-address}` command.

### Parameters

<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
<b>threshold-in msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
<b>interval minutes</b>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The threshold range is from 1 to 10 minutes.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

### Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

### Command History

Version	Description
9.7(0.0)	Introduced on the S6000-ON.

Version	Description
9.4(0.0)	Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.
9.3(0.0)	Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

## Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## Related Commands

[deny](#) — Assigns a IP ACL filter to deny IP packets.

[ip access-list standard](#) — Creates a standard ACL.

## permit arp (for Extended MAC ACLs)

Configure a filter that forwards ARP packets meeting this criteria. This command is supported only on 12-port GE line cards with SFP optics; refer to your line card documentation for specifications.

### Syntax

```
permit arp {destination-mac-address mac-address-mask | any}
vlan vlan-id {ip-address | any | opcode code-number} [count
[byte]] [order] [fragments] [log [interval minutes] [threshold-
in-msgs [count]]][monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `{destination-mac-address mac-address-mask | any} vlan vlan-id {ip-address | any | opcode code-number}` command.

## Parameters

<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
<b>threshold-in msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
<b>interval minutes</b>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

## Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

## permit udp (for Extended IP ACLs)

To pass UDP packets meeting the filter criteria, configure a filter.

### Syntax

```
permit udp {source mask | any | host ip-address} [operator port  
[port]] {destination mask | any | host ip-address} [dscp]  
[operator port [port]] [count [byte]] [order] [fragments] [log  
[interval minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit udp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

### Parameters

<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
<b>threshold-in msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation

of ACL logs is terminated with the `seq`, `permit`, or `deny` commands. The threshold range is from 1 to 100.

**interval**  
*minutes* (OPTIONAL) Enter the keyword `interval` followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.

**monitor** (OPTIONAL) Enter the keyword `monitor` when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

[permit](#) — configures a filter to forward packets.

## permit tcp (for Extended IP ACLs)

To pass TCP packets meeting the filter criteria, configure a filter.

### Syntax

```
permit tcp {source mask | any | host ip-address} [bit]
[operator port [port]] {destination mask | any | host ip-
address} [bit] [dscp] [operator port [port]] [count [byte]]
[order] [fragments] [log [interval minutes] [threshold-in-msgs
[count]]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit tcp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

### Parameters

<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
<b>threshold-in-msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
<b>interval minutes</b>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

### Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

### Command Modes

CONFIGURATION-EXTENDED-ACCESS-LIST

## Command History

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.4(0.0)	Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.
9.3(0.0)	Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

## Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## Related Commands

[ip access-list extended](#) — creates an extended ACL.

[permit](#) — assigns a permit filter for IP packets.

[permit udp](#) — assigns a permit filter for UDP packets.

## seq arp (for Extended MAC ACLs)

Configure an egress filter with a sequence number that filters ARP packets meeting this criteria. This command is supported only on 12-port GE line cards with SFP optics. For specifications, refer to your line card documentation.

 **NOTE:** Only the options that have been newly introduced in Release 9.3(0.0) and Release 9.4(0.0) are described here. For a complete description on all of the keywords and variables that are available with this command, refer the topic of this command discussed earlier in this guide.

**Syntax** `seq sequence-number {deny | permit} arp {destination-mac-address mac-address-mask | any} vlan vlan-id {ip-address | any | opcode code-number} [count [byte]] [order] [log [interval minutes] [threshold-in-msgs [count]] [monitor]`

To remove this filter, use the `no seq sequence-number` command.

### Parameters

<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
<b>threshold-in-msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. You can enter a threshold in the range of 1-100.
<b>interval minutes</b>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. You can enter an interval in the range of 1-10 minutes.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

### Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is 5 minutes. By default, flow-based monitoring is not enabled.

9.7(0.0)	Introduced on the S6000-ON.
9.4(0.0)	Added support for flow-based monitoring on the S4810, S4820T, S6000, Z9000, and MXL 10/40GbE Switch IO Module platforms.

Version	Description
9.3.0.0	Added support for logging of ACLs on the S4810, S4820T, Z9000, and MXL 10/40GbE Switch IO Module platforms.

### Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is reenabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is reenabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, standard and extended IPv6 ACLs, and standard and extended MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## seq ether-type (for Extended MAC ACLs)

Configure an egress filter with a specific sequence number that filters traffic with specified types of Ethernet packets. This command is supported only on 12-port GE line cards with SFP optics. For specifications, refer to your line card documentation.

 **NOTE:** Only the options that have been newly introduced in Release 9.3(0.0) and Release 9.4(0.0) are described here. For a complete description on all of the keywords and variables that are available with this command, refer the topic of this command discussed earlier in this guide.

### Syntax

```
seq sequence-number {deny | permit} ether-type protocol-type-number {destination-mac-address mac-address-mask | any} vlan vlan-id {source-mac-address mac-address-mask | any} [count [byte]] [order] [log [interval minutes] [threshold-in-msgs [count]]] [monitor]
```

To remove this filter, use the no seq *sequence-number* command.

## Parameters

<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
<b>threshold-in msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. You can enter a threshold in the range of 1-100.
<b>interval minutes</b>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. You can enter an interval in the range of 1-10 minutes.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

## Defaults

## Related Commands

[deny](#) — configures a filter to drop packets.

[permit](#) — configures a filter to forward packets.

## seq (for IPv6 ACLs)

Assign a sequence number to a deny or permit the filter in an IPv6 access list while creating the filter.

### Syntax

```
seq sequence-number {deny | permit} {ipv6-protocol-number |  
icmp | ip | tcp | udp} {source address mask | any | host ipv6-  
address} {destination address | any | host ipv6-address}  
[operator port [port]] [count [byte]] [log [interval minutes]]  
[threshold-in-msgs [count]] [monitor]
```

To delete a filter, use the `no seq sequence-number` command.

## Parameters

<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
<b>threshold-in msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminate with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
<b>interval minutes</b>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

#### Related Commands

[permit](#) – configures a filter to forward packets.

## permit udp (for IPv6 ACLs)

Configure a filter to pass UDP packets meeting the filter criteria.

#### Syntax

```
permit udp {source address mask | any | host ipv6-address}
[operator port [port]] {destination address | any | host ipv6-
address} [operator port [port]] [count [byte]] [log [interval
minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit udp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command.

#### Parameters

<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
<b>threshold-in msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
<b>interval minutes</b>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

**Defaults** By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

## Related Commands

[permit](#) – assigns a permit filter for IP packets.

## permit icmp (for IPv6 ACLs)

To allow all or specific internet control message protocol (ICMP) messages, configure a filter.

### Syntax

```
permit icmp {source address mask | any | host ipv6-address}
{destination address | any | host ipv6-address} [message-type]
[count [byte]] [log [interval minutes] [threshold-in-msgs
[count]]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit icmp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command.

### Parameters

**log** (OPTIONAL) Enter the keyword `log` to enable the triggering of ACL log messages.

<b>threshold-in msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
<b>interval minutes</b>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

**Defaults** By default, 10 ACL logs are generated if you do not specify the threshold explicitly. The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## permit (for IPv6 ACLs)

To configure a filter that matches the filter criteria, select an IPv6 protocol number, ICMP, IPv6, TCP, or UDP.

### Syntax

```
permit {ipv6-protocol-number | icmp | ipv6 | tcp | udp} [count  
[byte]] [dscp value] [order] [fragments] [log [interval  
minutes] [threshold-in-msgs [count]]] [monitor] [no-drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command syntax if you know the filter's sequence number
- Use the `no permit {ipv6-protocol-number | icmp | ipv6 | tcp | udp}` command

### Parameters

<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
<b>threshold-in msgs <i>count</i></b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
<b>interval <i>minutes</i></b>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.
<b>no-drop</b>	Enter the keywords <code>no-drop</code> to match only the forwarded packets.

### Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## deny udp (for IPv6 ACLs)

Configure a filter to drop user datagram protocol (UDP) packets meeting the filter criteria.

**Syntax**

```
deny udp {source address mask | any | host ipv6-address}
[operator port [port]] {destination address | any | host ipv6-
address} [operator port [port]] [count [byte]] [log [interval
minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command syntax if you know the filter's sequence number
- Use the `no deny udp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command

## Parameters

<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
<b>threshold-in msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
<b>interval minutes</b>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The threshold range is from 1 to 10 minutes.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

## Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

## Command Modes

ACCESS-LIST

## Command History

Version	Description
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.4(0.0)</b>	Added support for flow-based monitoring on the S4810, S4820T, S6000, Z9000, and MXL 10/40GbE Switch IO Module platforms.
<b>9.3(0.0)</b>	Added support for logging of ACLs on the S4810, S4820T, Z9000, and MXL 10/40GbE Switch IO Module platforms.

## Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs.

You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based `enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## deny tcp (for IPv6 ACLs)

Configure a filter that drops TCP packets that match the filter criteria.

### Syntax

```
deny tcp {source address mask | any | host ipv6-address}
[operator port [port]] {destination address | any | host ipv6-
address} [bit] [operator port [port]] [count [byte]] [log
[interval minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command syntax if you know the filter's sequence number
- Use the `no deny tcp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address} command`

### Parameters

<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
<b>threshold-in msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100..
<b>interval minutes</b>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.
<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

**Defaults** By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

**Command Modes** ACCESS-LIST

<b>Command History</b>	<b>Version</b>	<b>Description</b>
	<b>9.7(0.0)</b>	Introduced on the S6000–ON.
	<b>9.4(0.0)</b>	Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.
	<b>9.3(0.0)</b>	Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

**Usage Information** When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## deny icmp (for Extended IPv6 ACLs)

Configure a filter to drop all or specific ICMP messages.

 **NOTE:** Only the options that have been newly introduced in Release 9.3(0.0) and Release 9.4(0.0) are described here. For a complete description on all of the keywords and variables that are available with this command, refer the topic of this command discussed earlier in this guide.

**Syntax**

```
deny icmp {source address mask | any | host ipv6-address}
{destination address | any | host ipv6-address} [message-type]
[count [byte]] | [log [interval minutes] [threshold-in-msgs
[count]]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command syntax if you know the filter's sequence number
- Use the `no deny icmp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command

Parameters		
	<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
	<b>threshold-in msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. You can enter a threshold in the range of 1-100.
	<b>interval minutes</b>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. You can enter an interval in the range of 1-10 minutes.
	<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

**Defaults** By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is 5 minutes. By default, flow-based monitoring is not enabled.

**Command Modes** ACCESS-LIST

Command History	Version	Description
	9.7(0.0)	Introduced on the S6000-ON.

Version	Description
9.4(0.0)	Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.
9.3.0.0	Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

## Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

## deny (for IPv6 ACLs)

Configure a filter that drops IPv6 packets that match the filter criteria.

### Syntax

```
deny {ipv6-protocol-number | icmp | ipv6 | tcp | udp} [count
[byte]] [dscp value] [order] [fragments] [log [interval
minutes] [threshold-in-msgs [count]]] [monitor] [no-drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command syntax if you know the filter's sequence number
- Use the `no deny {ipv6-protocol-number | icmp | ipv6 | tcp | udp}` command

<b>Parameters</b>	<b>log</b>	(OPTIONAL) Enter the keyword <code>log</code> to enable the triggering of ACL log messages.
	<b>threshold-in msgs count</b>	(OPTIONAL) Enter the <code>threshold-in-msgs</code> keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the <code>seq</code> , <code>permit</code> , or <code>deny</code> commands. The threshold range is from 1 to 100.
	<b>interval minutes</b>	(OPTIONAL) Enter the keyword <code>interval</code> followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.
	<b>monitor</b>	(OPTIONAL) Enter the keyword <code>monitor</code> when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.
	<b>no-drop</b>	Enter the keywords <code>no-drop</code> to match only the forwarded packets.

**Defaults** By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

**Command Modes** ACCESS-LIST

<b>Command History</b>	<b>Version</b>	<b>Description</b>
	<b>9.8(0.0)</b>	Added the no-drop parameter.
	<b>9.7(0.0)</b>	Introduced on the S6000-ON.
	<b>9.4(0.0)</b>	Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.
	<b>9.3(0.0)</b>	Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

**Usage Information** When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based `enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

# Access Control List (ACL) VLAN Groups and Content Addressable Memory (CAM)

This chapter describes the access control list (ACL) virtual local area network (VLAN) group and content addressable memory (CAM) enhancements.

## member vlan

Add VLAN members to an ACL VLAN group.

<b>Syntax</b>	<code>member vlan {VLAN-range}</code>	
<b>Parameters</b>	<b>VLAN-range</b>	Enter the member VLANs using comma-separated VLAN IDs, a range of VLAN IDs, a single VLAN ID, or a combination. For example:  Comma-separated: 3, 4, 6  Range: 5-10  Combination: 3, 4, 5-10, 8
<b>Default</b>	None	
<b>Command Modes</b>	CONFIGURATION (conf-acl-vl-grp)	
<b>Command History</b>	<b>Version 9.3. (0.0)</b>	Introduced on the S4810, S4820T, and Z9000 platforms.
<b>Usage Information</b>	At a maximum, there can be only 32 VLAN members in all ACL VLAN groups. A VLAN can belong to only one group at any given time.  You can create an ACL VLAN group and attach the ACL with the VLAN members. The optimization is applicable only when you create an ACL VLAN group. If you apply an ACL separately on the VLAN interface, each ACL has a mapping with the VLAN and increased CAM space utilization occurs.	

Attaching an ACL individually to VLAN interfaces is similar to the behavior of ACL-VLAN mapping storage in CAM prior to the implementation of the ACL VLAN group functionality.

## ip access-group

Apply an egress IP ACL to the ACL VLAN group.

<b>Syntax</b>	<code>ip access-group {group name} out implicit-permit</code>	
<b>Parameters</b>	<b><i>group-name</i></b>	Enter the name of the ACL VLAN group where you want the egress IP ACLs applied, up to 140 characters.
	<b>out</b>	Enter the keyword <code>out</code> to apply the ACL to outgoing traffic.
	<b>implicit-permit</b>	Enter the keyword <code>implicit-permit</code> to change the default action of the ACL from <code>implicit-deny</code> to <code>implicit-permit</code> (that is, if the traffic does not match the filters in the ACL, the traffic is permitted instead of dropped).
<b>Default</b>	None	
<b>Command Modes</b>	CONFIGURATION (conf-acl-vl-grp)	
<b>Command History</b>	<b>Version 9.3. (0.0)</b>	Introduced on the S4810, S4820T, and Z9000 platforms.
<b>Usage Information</b>	You can apply only an egress IP ACL on an ACL VLAN group.	

## show acl-vlan-group

Display all the ACL VLAN groups or display a specific ACL VLAN group, identified by name.

<b>Syntax</b>	<code>show acl-vlan-group {group-name   detail}</code>	
<b>Parameters</b>	<b><i>group-name</i></b>	(Optional) Display only the ACL VLAN group that is specified, up to 140 characters.
	<b><i>detail</i></b>	Display information in a line-by-line format to display the names in their entirety.

Without the detail option, the output displays in a table style and information may be truncated.

<b>Default</b>	No default behavior or values
<b>Command Modes</b>	EXEC EXEC Privilege
<b>Command History</b>	<b>Version 9.3. (0.0)</b> Introduced on the S4810, S4820T, Z9000 and MXL platforms
<b>Usage Information</b>	When an ACL-VLAN-Group name or the Access List Group Name contains more than 30 characters, the name is truncated in the show <code>acl-vlan-group</code> command output.
<b>Examples</b>	The following sample illustrates the output of the show <code>acl-vlan-group</code> command.

 **NOTE:** Some group names and some access list names are truncated.

```
Dell#show running-config acl-vlan-group
!
acl-vlan-group Test
  member vlan 1-100
  ip access-group test in
Dell#show acl-vlan-group
Group Name      Egress IP Acl      Ingress IP Acl      Ingress V6
Acl             Vlan Members
Test           -                   test
-              1-100
```

The following sample output is displayed when using the show `acl-vlan-group group-name` option.

 **NOTE:** The access list name is truncated.

```
Dell#show acl-vlan-group TestGroupSeventeenTwenty
Group Name      Egress IP Acl      Ingress IP Acl      Ingress
IPV6 Acl       Vlan Members      Test
-              test              -
1-100
```

The following sample output shows the line-by-line style display when using the show `acl-vlan-group detail` option.

 **NOTE:** No group or access list names are truncated

```
Dell#show acl-vlan-group detail

Group Name :
  Test
Egress IP Acl :
  -
Ingress IP Acl :
```

```

test
Ingress IPV6 Acl :
-
Vlan Members :
1-100

```

## show cam-acl-vlan

Display the number of flow processor (FP) blocks that is allocated for the different VLAN services.

<b>Syntax</b>	show cam-acl-vlan	
<b>Command Modes</b>	EXEC Privilege	
<b>Command History</b>	<b>Version 9.3. (0.0)</b>	Introduced on the S4810, S4820T, Z9000 and MXL platforms.

**Usage Information** After CAM configuration for ACL VLAN groups is performed, you must reboot the system to enable the settings to be stored in nonvolatile storage. During the initialization of CAM, the chassis manager reads the NVRAM and allocates the dynamic VCAP regions.

The following table describes the output fields of this `show` command:

Field	Description
Chassis Vlan Cam ACL	Details about the CAM blocks allocated for ACLs for various VLAN operations at a system-wide, global level.
Stack Unit <number>	Details about the CAM blocks allocated for ACLs for various VLAN operations for a particular stack unit.
Current Settings(in block sizes)	Information about the number of FP blocks that are currently in use or allocated.
VlanOpenFlow	Number of FP blocks for VLAN open flow operations.
VlanIscsi	Number of FP blocks for VLAN internet small computer system interface (iSCSI) counters.
VlanHp	Number of FP blocks for VLAN high performance processes.
VlanFcoe	Number of FP blocks for VLAN Fiber Channel over Ethernet (FCoE) operations.

Field	Description
VlanAclOpt	Number of FP blocks for ACL VLAN optimization feature.

### Example

```
Dell#show cam-acl-vlan

-- Chassis Vlan Cam ACL --
      Current Settings (in block sizes)
VlanOpenFlow :      0
VlanIscsi    :      0
VlanAclOpt   :      2
VlanHp       :      1
VlanFcoe     :      1
```

## cam-acl-vlan

Allocate the number of flow processor (FP) blocks or entries for VLAN services and processes.

**Syntax** `cam-acl-vlan { default | vlanopenflow <0-2> | vlaniscsi <0-2> | vlanaclopt <0-2>`

### Parameters

<b>default</b>	Reset the number of FP blocks to default. By default, 0 groups are allocated for the ACL in VCAP. ACL VLAN groups or CAM optimization is not enabled by default, and you need to allocate the slices for CAM optimization.
<b>vlanopenflow &lt;0-2&gt;</b>	Allocate the number of FP blocks for VLAN open flow operations.
<b>vlaniscsi &lt;0-2&gt;</b>	Allocate the number of FP blocks for VLAN iSCSI counters.
<b>vlanaclopt &lt;0-2&gt;</b>	Allocate the number of FP blocks for the ACL VLAN optimization feature.

### Default

If you use the `default` keyword with the `cam-acl-vlan` command, the FP blocks allocated for VLAN processes are restored to their default values. No FP blocks or dynamic VLAN Content Aware Processor (VCAP) groups are allocated for VLAN operations by default.

### Command Modes

CONFIGURATION

### Command History

Version	Description
9.3(0.0)	Introduced on the S4810 and Z9000 platforms.

**Usage Information** The VLAN ContentAware Processor (VCAP) application is a pre-ingress CAP that modifies the VLAN settings before packets are forwarded. To support the ACL CAM optimization functionality, the CAM carving feature is enhanced. A total of four VACP groups are present, of which two are for fixed groups and the other two are for dynamic groups. Out of the total of two dynamic groups, you can allocate zero, one, or two flow processor (FP) blocks to iSCSI Counters, OpenFlow and ACL Optimization. You can configure only two of these features at a point in time.

## show cam-usage

View the amount of CAM space available, used, and remaining in each partition (including IPv4Flow and Layer 2 ACL sub-partitions).

<b>Syntax</b>	<code>show cam-usage [acl   router   switch]</code>	
<b>Parameters</b>	<b>acl</b>	(OPTIONAL) Enter the keyword <code>acl</code> to display Layer 2 and Layer 3 ACL CAM usage.
	<b>router</b>	(OPTIONAL) Enter the keyword <code>router</code> to display Layer 3 CAM usage.
	<b>switch</b>	(OPTIONAL) Enter the keyword <code>switch</code> to display Layer 2 CAM usage.
<b>Command Modes</b>	EXEC EXEC Privilege	
<b>Command History</b>	<b>Version 9.3. (0.0)</b>	Introduced on the S4810, S4820T, Z9000 and MXL platforms.

**Usage Information** The following regions must be provided in the `show cam-usage` output:

- L3AcCam
- L2AcCam
- V6AcCam

The following table describes the output fields of this `show` command:

Field	Description
LineCard	Number of the line card that contains information on ACL VLAN groups
Portpipe	The hardware path that packets follow through a system for ACL optimization
CAM-Region	Type of area in the CAM block that is used for ACL VLAN groups
Total CAM space	Total amount of space in the CAM block
Used CAM	Amount of CAM space that is currently in use
Available CAM	Amount of CAM space that is free and remaining to be allocated for ACLs

**Example 1:**  
**Output of the**  
**show cam-**  
**usage**  
**Command**

```
Dell#show cam-usage

```

## show running config acl-vlan-group

Display the running configuration of all or a given ACL VLAN group.

**Syntax** `show running config acl-vlan-group group name`

**Parameters** `group-name` Display only the ACL VLAN group that is specified. The maximum group name is 140 characters.

**Default** None

**Command Modes** EXEC

EXEC Privilege

**Command History** **Version 9.3.** Introduced on the S4810, S4820T, Z9000 and MXL platforms  
**(0.0)**

**Examples** The following sample output shows the line-by-line style display when using the `show running-config acl-vlan-group` option. Note that no group or access list names are truncated

```
Dell#show running-config acl-vlan-group
!
acl-vlan-group Test
 member vlan 1-100
 ip access-group test in

```

```

Dell#show running-config acl-vlan-group Test
!
acl-vlan-group Test
  member vlan 1-100
  ip access-group test in

```

## acl-vlan-group

Create an ACL VLAN group.

**Syntax** `acl-vlan-group {group name}`  
 To remove an ACL VLAN group, use the `no acl-vlan-group {group name}` command.

**Parameters**

**group-name** Specify the name of the ACL VLAN group. The name can contain a maximum 140 characters.

**Default** No default behavior or values

**Command Modes** CONFIGURATION

**Command History**

**Version 9.3(0.0)** Introduced on the S4810, S4820T and Z9000 platforms

**Usage Information**

You can have up to eight different ACL VLAN groups at any given time. When you configure an ACL VLAN group, you enter the ACL VLAN Group Configuration mode.

To avoid the problem of excessive consumption of CAM area, you can configure ACL VLAN groups that combines all the VLANs that are applied with the same ACL in a single group. A unique identifier for each of ACL attached to the VLAN is used as a handle or locator in the CAM area instead of the VLAN id. This method of processing significantly reduces the number of entries in the CAM area and saves memory space in CAM.

You can create an ACL VLAN group and attach the ACL with the VLAN members. Optimization is applicable only when you create an ACL VLAN group. If you apply an ACL separately on the VLAN interface, each ACL maps with the VLAN and increased CAM space utilization occurs.

Attaching an ACL individually to VLAN interfaces is similar to the behavior of ACL-VLAN mapping storage in CAM prior to the implementation of the ACL VLAN group functionality.

## show acl-vlan-group detail

Display all the ACL VLAN Groups or display a specific ACL VLAN Group by name. To display the names in their entirety, the output displays in a line-by-line format.

**Syntax** `show acl-vlan-group detail`

**Parameters**

<b>detail</b>	Display information in a line-by-line format to display the names in their entirety.
	Without the detail option, the output is displayed in a table style and information may be truncated.

**Default** No default behavior or values

**Command Modes** EXEC

EXEC Privilege

**Command History**

<b>Version 9.3. (0.0)</b>	Introduced on the S4810, S4820T, Z9000, and MXL platforms
---------------------------	---

**Usage Information** The output for this command displays in a line-by-line format. This allows the ACL-VLAN-Group names (or the Access List Group Names) to display in their entirety.

**Examples** The following sample output shows the line-by-line style display when using the `show acl-vlan-group detail` option. Note that no group or access list names are truncated

```
Dell#show acl-vlan-group detail

Group Name :
  Test
Egress IP Acl :
  -
Ingress IP Acl :
  test
Ingress IPV6 Acl :
  -
Vlan Members :
  1-100
```

## description (ACL VLAN Group)

Add a description to the ACL VLAN group.

<b>Syntax</b>	<code>description <i>description</i></code>
<b>Parameters</b>	<b><i>description</i></b> Enter a description to identify the ACL VLAN group (80 characters maximum).
<b>Default</b>	No default behavior or values
<b>Command Modes</b>	CONFIGURATION (conf-acl-vl-grp)
<b>Command History</b>	<b>Version 9.3. (0.0)</b> Introduced on the S4810, S4820T, and Z9000 platforms
<b>Usage Information</b>	Enter a description for each ACL VLAN group that you create for effective and streamlined administrative and logging purposes.

# Bidirectional Forwarding Detection (BFD)

Bidirectional forwarding detection (BFD) is a detection protocol that provides fast forwarding path failure detection.

The Dell Networking operating software implementation is based on the standards specified in the IETF Draft draft-ietf-bfd-base-03 and supports BFD on all Layer 3 physical interfaces including VLAN interfaces and port-channels

## bfd all-neighbors

Enable BFD sessions with all neighbors discovered by Layer 3 protocols virtual router redundancy protocol (VRRP), intermediate system to intermediate system (IS-IS), open shortest path first (OSPF), OSPFv3, or border gateway protocol (BGP) on router interfaces, and (optionally) reconfigure the default timer values.

### S4820T

#### Syntax

```
bfd all-neighbors [interval interval min_rx min_rx multiplier
value role {active | passive}]
```

#### Parameters

<b>interval</b> <i>milliseconds</i>	(OPTIONAL) Enter the keyword <code>interval</code> to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is <b>100</b> .
<b>min_rx</b> <i>milliseconds</i>	Enter the keyword <code>min_rx</code> to specify the minimum rate at which the local system would like to receive control packets from the remote system. The range is from 50 to 100. The default is <b>100</b> .
<b>multiplier</b> <i>value</i>	Enter the keyword <code>multiplier</code> to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is <b>3</b> .
<b>role</b> [active   passive]	Enter the role that the local system assumes: <ul style="list-style-type: none"> <li>• <i>Active</i> — The active system initiates the BFD session. Both systems can be active for the same session.</li> <li>• <i>Passive</i> — The passive system does not initiate a session. It only responds to a request for session initialization from the active system.</li> </ul>

The default is **active**.

**Defaults** Refer to *Parameters*.

**Command Modes**

ROUTER OSPF

ROUTER OSPFv3

ROUTER BGP

ROUTER ISIS

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
9.2.(0.0)	Introduced BFD for VRRP and OSPFv3 on Z9000, S4810, and S4820T.
9.0.0.0	Introduced BFD for BGP on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.8.0	Introduced BFD for BGP on the S4810.
8.4.1.3	Introduced BFD for BGP on the E-Series ExaScale.
8.2.1.0	Introduced BFD for OSPF and ISIS on the E-Series ExaScale.
7.6.1.0	Introduced BFD for OSPF on the C-Series.
7.5.1.0	Introduced BFD for ISIS on the E-Series.
7.4.1.0	Introduced BFD for OSPF on the E-Series.

**Usage Information** All neighbors inherit the timer values configured with the `bfd neighbor` command except in the following cases:

- Timer values configured with the `isis bfd all-neighbors` or `ip ospf bfd all-neighbors` commands in INTERFACE mode override timer values configured with the `bfd neighbor` command. Likewise, using the `no bfd neighbor` command does not disable BFD on an interface if you explicitly enable BFD using the `isis bfd all-neighbors` command.
- Neighbors that have been explicitly enabled or disabled for a BFD session with the `bfd neighbor` or `neighbor bfd disable` commands in ROUTER BGP mode do not inherit the global BFD enable/disable values configured with the `bfd neighbor` command or configured for the peer group to which a

neighbor belongs. The neighbors inherit only the global timer values (configured with the `bfd neighbor` command).

You can only enable BFD for VRRP in INTERFACE command mode (`vrrp bfd all-neighbors`).

**Related  
Commands**

[neighbor bfd disable](#) — Explicitly disables a BFD session with a BGP neighbor or a BGP peer group.

## bfd disable

Disable BFD on an interface.

### S4820T

**Syntax**

`bfd disable`  
Re-enable BFD using the `no bfd disable` command.

**Defaults**

BFD is disabled by default.

**Command  
Modes**

VRRP

**Command  
History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.2(0.2)	Introduced on S4810.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.2.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the C-Series.
7.5.1.0	Introduced on the E-Series.

## bfd enable (Configuration)

Enable BFD on all interfaces.

### S4820T

<b>Syntax</b>	<code>bfd enable</code> Disable BFD using the <code>no bfd enable</code> command.
<b>Defaults</b>	BFD is disabled by default.
<b>Command Modes</b>	CONFIGURATION
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.10.0	Introduced on the S4810.
8.2.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the C-Series.
7.4.1.0	Introduced on the E-Series.

## bfd enable (Interface)

Enable BFD on an interface.

### S4820T

<b>Syntax</b>	<code>bfd enable</code>
<b>Defaults</b>	BFD is enabled on all interfaces when you enable BFD from CONFIGURATION mode.
<b>Command Modes</b>	INTERFACE
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.10.0	Introduced on the S4810.
8.2.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the C-Series.
7.4.1.0	Introduced on the E-Series.

## bfd interval

Specify non-default BFD session parameters beginning with the transmission interval.

### S4820T

**Syntax** `bfd interval interval min_rx min_rx multiplier value role {active | passive}`

Parameters	
<b>interval</b> <i>milliseconds</i>	Enter the keywords <code>interval</code> to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is <b>100</b> .
<b>min_rx</b> <i>milliseconds</i>	Enter the keywords <code>min_rx</code> to specify the minimum rate at which the local system would like to receive control packets from the remote system. The range is from 50 to 1000. The default is <b>100</b> .
<b>multiplier</b> <i>value</i>	Enter the keywords <code>multiplier</code> to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is <b>3</b> .
<b>role</b> { <b>active</b>   <b>passive</b> }	Enter the role that the local system assumes: <ul style="list-style-type: none"><li>• <b>Active</b> — The active system initiates the BFD session. Both systems can be active for the same session.</li><li>• <b>Passive</b> — The passive system does not initiate a session. It only responds to a request for session initialization from the active system.</li></ul> The default is <b>Active</b> .

**Defaults** Refer to *Parameters*.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.10.0	Introduced on the S4810.
8.2.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the C-Series.
7.4.1.0	Introduced on the E-Series.

**Example**

```
Dell(conf-if-te-1/3)#bfd interval 250 min_rx 300 multiplier 4
role passive
Dell(conf-if-te-1/3)#
```

## bfd neighbor

Establish a BFD session with a neighbor.

**Syntax** `bfd neighbor ip-address`

To remove the BFD session with the neighbor, use the `no bfd neighbor ip-address` command.

**Parameters**

<b><i>ip-address</i></b>	Enter the IP address of the neighbor in dotted decimal format (A.B.C.D).
--------------------------	--

**Defaults** none

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.10.0	Introduced on the S4810.
8.2.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the C-Series.
7.5.1.0	Added support for VLAN and port-channel interfaces on the E-Series.

**Related Commands** [show bfd neighbors](#) — displays the BFD neighbor information on all interfaces or a specified interface.

## bfd protocol-liveness

Enable the BFD protocol liveness feature.

### S4820T

**Syntax** `bfd protocol-liveness`

**Defaults** Disabled

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.10.0	Introduced on the S4810.
7.4.1.0	Introduced on the E-Series.

**Usage Information** Protocol Liveness is a feature that notifies the BFD Manager when a client protocol (for example, OSPF and ISIS) is disabled. When a client is disabled, all BFD sessions for that protocol are torn down. Neighbors on the remote system receive an Admin Down control packet and are placed in the Down state. Peer routers might take corrective action by choosing alternative paths for the routes that originally pointed to this router.

# ip route bfd

Enable BFD for all neighbors configured through static routes.

## S4820T

### Syntax

```
ip route bfd [interval interval min_rx min_rx multiplier value
role {active | passive}]
```

To disable BFD for all neighbors configured through static routes, use the `no ip route bfd [interval interval min_rx min_rx multiplier value role {active | passive}]` command.

### Parameters

**interval**  
*milliseconds* (OPTIONAL) Enter the keywords `interval` to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is **100**.

**min\_rx**  
*milliseconds* Enter the keywords `min_rx` to specify the minimum rate at which the local system receives control packets from the remote system. The range is from 50 to 1000. The default is **100**.

**multiplier** *value* Enter the keywords `multiplier` to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is **3**.

**role** [active | passive] Enter the role that the local system assumes:

- *Active* — The active system initiates the BFD session. Both systems can be active for the same session.
- *Passive* — The passive system does not initiate a session. It only responds to a request for session initialization from the active system.

The default is **Active**.

### Defaults

Version	Description
7.4.1.0	Introduced on the E-Series.

## ipv6 ospf bfd all-neighbors

Establish BFD sessions with all OSPFv3 neighbors on a single interface or use non-default BFD session parameters.

### S4820T

#### Syntax

```
ipv6 ospf bfd all-neighbors [disable | [interval interval
min_rx min_rx multiplier value role {active | passive}]]
```

To disable all BFD sessions on an OSPFv3 interface implicitly, use the `no ipv6 ospf bfd all-neighbors disable` command in interface mode.

#### Parameters

<b>disable</b>	(OPTIONAL) Enter the keyword <code>disable</code> to disable BFD on this interface.
<b>interval <i>milliseconds</i></b>	(OPTIONAL) Enter the keyword <code>interval</code> to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is <b>100</b> .
<b>min_rx <i>milliseconds</i></b>	Enter the keywords <code>min_rx</code> to specify the minimum rate at which the local system receives control packets from the remote system. The range is from 50 to 100. The default is <b>100</b> .
<b>multiplier <i>value</i></b>	Enter the keyword <code>multiplier</code> to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is <b>3</b> .
<b>role [active   passive]</b>	Enter the role that the local system assumes: <ul style="list-style-type: none"> <li><code>Active</code> — The active system initiates the BFD session. Both systems can be active for the same session.</li> <li><code>Passive</code> — The passive system does not initiate a session. It only responds to a request for session initialization from the active system.</li> </ul> <p>The default is <b>Active</b>.</p>

**Defaults** See Parameters

**Command Modes** INTERFACE

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.2.0.0	Introduced on the Z9000, S4820T, and S4810.

## Usage Information

This command provides the flexibility to fine-tune the timer values based on individual interface needs when you configure `ipv6 ospf BFD` in CONFIGURATION mode. Any timer values specified with this command overrides timers set using the `bfd all-neighbors` command. Using the `no` form of this command does not disable BFD if you configure BFD in CONFIGURATION mode.

To disable BFD on a specific interface while you configure BFD in CONFIGURATION mode, use the keyword `disable`.

# isis bfd all-neighbors

Enable BFD on all IS-IS neighbors discovered on an interface.

## S4820T

### Syntax

```
isis bfd all-neighbors [disable | [interval interval min_rx  
min_rx multiplier value role {active | passive}]]
```

To remove all BFD sessions with IS-IS neighbors discovered on this interface, use the `no isis bfd all-neighbors [disable | [interval interval min_rx min_rx multiplier value role {active | passive}]]` command.

### Parameters

<b>disable</b>	(OPTIONAL) Enter the keyword <code>disable</code> to disable BFD on this interface.
<b>interval <i>milliseconds</i></b>	(OPTIONAL) Enter the keywords <code>interval</code> to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is <b>100</b> .
<b>min_rx <i>milliseconds</i></b>	Enter the keywords <code>min_rx</code> to specify the minimum rate at which the local system would like to receive control packets from the remote system. The range is from 50 to 1000. The default is <b>100</b> .
<b>multiplier <i>value</i></b>	Enter the keywords <code>multiplier</code> to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is <b>3</b> .

**role** [active | passive]

Enter the role that the local system assumes:

- **Active** — The active system initiates the BFD session. Both systems can be active for the same session.
- **Passive** — The passive system does not initiate a session. It only responds to a request for session initialization from the active system.

The default is **Active**.

**Defaults**

See Parameters

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.0.0.0	Introduced on Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on S4810.
8.2.1.0	Introduced on the E-Series ExaScale.
7.5.1.0	Introduced on the E-Series.

**Usage Information**

This command provides the flexibility to fine-tune the timer values based on individual interface needs when ISIS BFD is configured in CONFIGURATION mode. Any timer values specified with this command overrides timers set using the `bfd all-neighbors` command. Using the `no` form of this command does not disable BFD if BFD is configured in CONFIGURATION mode.

To disable BFD on a specific interface while BFD is configured in CONFIGURATION mode, use the keyword `disable`.

## neighbor bfd

Explicitly enable a BFD session with a BGP neighbor or a BGP peer group.

### S4820T

**Syntax**                    `neighbor {ip-address | peer-group-name} bfd`

## Parameters

<i>ip-address</i>	Enter the IP address of the BGP neighbor that you want to explicitly enable for BFD sessions in dotted decimal format (A.B.C.D).
<i>peer-group-name</i>	Enter the name of the peer group that you want to explicitly enable for BFD sessions.

## Defaults

none

## Command Modes

ROUTER BGP

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.8.0	Introduced on the S4810.
8.4.1.3	Introduced on the E-Series ExaScale.

## Usage Information

When you enable a BFD session with a specified BGP neighbor or peer group using the `bfd neighbor` command, the default BFD session parameters are used (interval: **100** milliseconds, min\_rx: **100** milliseconds, multiplier: **3** packets, and role: **active**) if you have not specified parameters with the `bfd neighbor` command.

When you explicitly enable a BGP neighbor for a BFD session with the `bfd neighbor` command:

- The neighbor does not inherit the global BFD enable values configured with the `bfd neighbor` command or configured for the peer group to which the neighbor belongs.
- The neighbor only inherits the global timer values configured with the `bfd neighbor` command: interval, min\_rx, and multiplier.

## Related Commands

[neighbor bfd disable](#) — Explicitly disables a BFD session with a BGP neighbor or a BGP peer group.

# neighbor bfd disable

Explicitly disable a BFD session with a BGP neighbor or a BGP peer group.

## S4820T

<b>Syntax</b>	<code>neighbor {ip-address   peer-group-name} bfd disable</code>	
<b>Parameters</b>	<b><i>ip-address</i></b>	Enter the IP address of the BGP neighbor that you want to explicitly disable for BFD sessions in dotted decimal format (A.B.C.D).
	<b><i>peer-group-name</i></b>	Enter the name of the peer group that you want to explicitly disable for BFD sessions.
<b>Defaults</b>	none	
<b>Command Modes</b>	ROUTER BGP	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .	

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.8.0	Introduced on the S4810.
8.4.1.3	Introduced on the E-Series ExaScale.

<b>Usage Information</b>	<p>When you explicitly disable a BGP neighbor for a BFD session with the <code>neighbor bfd disable</code> command:</p> <ul style="list-style-type: none"><li>• The neighbor does not inherit the global BFD disable values configured with the <code>bfd neighbor</code> command or configured for the peer group to which the neighbor belongs.</li><li>• The neighbor only inherits the global timer values configured with the <code>bfd neighbor</code> command: <code>interval</code>, <code>min_rx</code>, and <code>multiplier</code>.</li></ul>
--------------------------	--

When you remove the Disabled state of a BFD for a BGP session with a specified neighbor by entering the `no neighbor bfd disable` command, the BGP link with the neighbor returns to normal operation and uses the BFD session parameters globally configured with the `bfd neighbor` command or configured for the peer group to which the neighbor belongs.

**Related  
Commands**

[neighbor bfd](#) — Explicitly enables a BFD session with a BGP neighbor or a BGP peer group.

## show bfd neighbors

Display BFD neighbor information on all interfaces or a specified interface.

### S4820T

**Syntax** `show bfd neighbors interface [detail]`

**Parameters**

- |                         |   |
|-------------------------|---|
| <b><i>interface</i></b> | Enter one of the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li><li>• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li></ul> |
| <b><i>detail</i></b>    | (OPTIONAL) Enter the keyword <code>detail</code> to view detailed information about BFD neighbors.  |

**Defaults** `none`

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

<b>Version</b>	<b>Description</b>
<b>9.0.0.0</b>	Introduced on the Z9000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.8.0</b>	Added support for BFD for BGP on the S4810.
<b>8.4.1.3</b>	Added support for BFD for BGP on the E-Series ExaScale.

Version	Description
8.2.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the C-Series.
7.5.1.0	Added support for BFD for VLAN and port-channel interfaces on the E-Series.
7.4.1.0	Introduced BFD on physical ports on the E-Series.

#### Example

```
Dell#show bfd neighbors

*      - Active session role
Ad Dn - Admin Down
B      - BGP
C      - CLI
I      - ISIS
O      - OSPF
R      - Static Route (RTM)

      LocalAddr  RemoteAddr  Interface  State  Rx-int  Tx-int  Mult
Clients
* 10.1.3.2    10.1.3.1    Te 1/3     Up     300     250     3     C
```

#### Example (Detail)

```
Dell#show bfd neighbors detail

Session Discriminator: 1
Neighbor Discriminator: 1
Local Addr: 10.1.3.2
Local MAC Addr: 00:01:e8:02:15:0e
Remote Addr: 10.1.3.1
Remote MAC Addr: 00:01:e8:27:2b:f1
Int: TenGigabitEthernet 1/3
State: Up
Configured parameters:
  TX: 100ms, RX: 100ms, Multiplier: 3
Neighbor parameters:
  TX: 250ms, RX: 300ms, Multiplier: 4
Actual parameters:
  TX: 300ms, RX: 250ms, Multiplier: 3
Role: Active
Delete session on Down: False
Client Registered: CLI
Uptime: 00:02:04
Statistics:
  Number of packets received from neighbor: 376
  Number of packets sent to neighbor: 314
  Number of state changes: 2
  Number of messages from IFA about port state change: 0
  Number of messages communicated b/w Manager and Agent: 6
Dell#
```

#### Related Commands

[bfd all-neighbors](#) — establishes BFD sessions with all neighbors discovered by the IS-IS protocol or OSPF protocol out of all interfaces.

# vrrp bfd neighbor

Establish a BFD for VRRP session with a neighbor.

## S4820T

**Syntax** `vrrp bfd neighbor ip-address`  
To remove the BFD session with the neighbor, use the `no vrrp bfd neighbor ip-address` command.

**Parameters** `ip-address` Enter the IP address of the neighbor in dotted decimal format (A.B.C.D).

**Defaults** none

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.10.0	Introduced on the S4810.
8.2.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the C-Series.
7.5.1.0	Added support for VLAN and port-channel interfaces on the E-Series.
7.4.1.0	Introduced on the E-Series.

**Related Commands** [show bfd neighbors](#) — displays the BFD neighbor information on all interfaces or a specified interface.

# Border Gateway Protocol

BGP is an external gateway protocol that transmits interdomain routing information within and between autonomous systems (AS). BGP version 4 (BGPv4) supports classless inter-domain routing (CIDR) and the aggregation of routes and AS paths. Basically, two routers (called neighbors or peers) exchange information including full routing tables and periodically sent messages to update those routing tables.

BGP is supported in Dell Networking OS version 8.3.19.0 for the S4820T platform

 **NOTE:** For more information about configuring the border gateway protocol (BGP), refer to the BGP chapter in the *Dell Networking OS Configuration Guide*.

This chapter contains the following sections:

- BGPv4 Commands
- MBGP Commands
- BGP Extended Communities (RFC 4360)
- IPv6 BGP Commands

## BGP IPv4 Commands

Border Gateway Protocol (BGP) is an external gateway protocol that transmits interdomain routing information within and between Autonomous Systems (AS). BGP supports classless interdomain routing (CIDR) and the aggregation of routes and AS paths. Basically, two routers (called neighbors or peers) exchange information including full routing tables and periodically send messages to update those routing tables.

 **NOTE:** Dell Networking OS supports 2-byte (16-bit) and 4-byte (32-bit) format for autonomous system numbers (ASNs), where the 2-byte format is 1 to 65535 and the 4-byte format is 1 to 4294967295.

 **NOTE:** Dell Networking OS supports dotted format as well as the traditional plain format for AS numbers. The dot format is displayed when using the `show ip bgp` commands. To determine the comparable dot format for an ASN from a traditional format, use `ASN/65536`. `ASN%65536`. For more information about using the 2- or 4-byte format, refer to the *Dell Networking OS Configuration Guide*.

## address-family

Enable the IPv4 multicast or the IPv6 address family.

### S4820T

<b>Syntax</b>	<code>address-family [ipv4 {multicast   vrf vrf-name}   ipv6 unicast [vrf vrf-name]]</code>
<b>Parameters</b>	
<b>ipv4 multicast</b>	Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to enable BGPv4 multicast mode.
<b>ipv4 vrf vrf-name</b>	Enter the keyword <code>ipv4</code> followed by the keyword <code>vrf</code> and then the name of the VRF to enable VRF mode.   <b>NOTE:</b> Use this attribute to start a BGP instance corresponding to either a specific address family in a default VRF or an IPv4 address family in a non-default VRF.
<b>ipv6 unicast</b>	Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to enable BGPv6 mode.
<b>vrf vrf-name</b>	(Optional) Enter the keyword <code>vrf</code> followed by the name of the VRF to install the IPv6 route in that VRF.   <b>NOTE:</b> It will not be possible to enable VRF mode for IPv6 unicast without configuring the corresponding IPv4 unicast mode for the same VRF. While deletion, whenever the IPv4 VRF mode is deleted for the VRF, it will automatically delete the IPv6 VRF configurations as well.
<b>Defaults</b>	Not configured.
<b>Command Modes</b>	ROUTER BGP
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Added support for IPv6 VRF.
9.4.(0.0)	Added support for VRF.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.

Version	Description
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
6.5.1.0	Introduced

## aggregate-address

To minimize the number of entries in the routing table, summarize a range of prefixes.

### S4820T

**Syntax** `aggregate-address ip-address mask [advertise-map map-name] [as-set] [attribute-map map-name] [summary-only] [suppress-map map-name]`

#### Parameters

<b><i>ip-address</i></b> <b><i>mask</i></b>	Enter the IP address and mask of the route to be the aggregate address. Enter the IP address in dotted decimal format (A.B.C.D) and mask in /prefix format (/x).
<b><i>advertise-map</i></b> <b><i>map-name</i></b>	(OPTIONAL) Enter the keywords <code>advertise-map</code> then the name of a configured route map to set filters for advertising an aggregate route.
<b><i>as-set</i></b>	(OPTIONAL) Enter the keyword <code>as-set</code> to generate path attribute information and include it in the aggregate.  AS_SET includes AS_PATH and community information from the routes included in the aggregated route.
<b><i>attribute-map</i></b> <b><i>map-name</i></b>	(OPTIONAL) Enter the keywords <code>attribute-map</code> then the name of a configured route map to modify attributes of the aggregate, excluding AS_PATH and NEXT_HOP attributes.
<b><i>summary-only</i></b>	(OPTIONAL) Enter the keyword <code>summary-only</code> to advertise only the aggregate address. Specific routes are not advertised.
<b><i>suppress-map</i></b> <b><i>map-name</i></b>	(OPTIONAL) Enter the keywords <code>suppress-map</code> then the name of a configured route map to identify which more-specific routes in the aggregate are suppressed.

**Defaults** Not configured.

**Command Modes**

- ROUTER BGP ADDRESS FAMILY
- ROUTER BGP ADDRESS FAMILY IPv6

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

#### Usage Information

At least one of the routes included in the aggregate address must be in the BGP routing table for the configured aggregate to become active.

If routes within the aggregate are constantly changing, do not add the `as-set` parameter to the aggregate as the aggregate flaps to keep track of the changes in the `AS_PATH`.

In route maps used in the `suppress-map` parameter, routes meeting the `deny` clause are not suppress; in other words, they are allowed. The opposite is also true: routes meeting the `permit` clause are suppressed.

If the route is injected via the `network` command, that route still appears in the routing table if the `summary-only` parameter is configured in the `aggregate-address` command.

The `summary-only` parameter suppresses all advertisements. If you want to suppress advertisements to only specific neighbors, use the `neighbor distribute-list` command.

In the `show ip bgp` command, aggregates contain an 'a' in the first column and routes suppressed by the aggregate contain an 's' in the first column.

When an aggregate address is denied using a peer's outbound route-map, individual routes suppressed by the aggregate address are advertised to that peer.

The attribute-map corresponding to an aggregate address is applied during the outbound update creation time; hence the value set in that attribute-map will not be shown in the output of the `show ip bgp aggregate route` command.

## bgp always-compare-med

Allows you to enable comparison of the MULTI\_EXIT\_DISC (MED) attributes in the paths from different external ASs.

### S4820T

<b>Syntax</b>	<code>bgp always-compare-med</code> To disable comparison of MED, enter <code>no bgp always-compare-med</code> .
<b>Defaults</b>	Disabled (that is, the software only compares MEDs from neighbors within the same AS).
<b>Command Modes</b>	ROUTER BGP
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .  The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced command.
7.7.1.0	Introduced on the C-Series.

<b>Usage Information</b>	Any update without a MED attribute is the least preferred route.  If you enable this command, use the <code>clear ip bgp *</code> command to recompute the best path.
--------------------------	---

## bgp add-path

Allow the advertisement of multiple paths for the same address prefix without the new paths replacing any previous ones.

### S4820T

<b>Syntax</b>	<code>bgp add-path [send   receive   both] path-count</code>
---------------	--

<b>Parameters</b>	<b>send</b>	Enter the keyword <code>send</code> to indicate that the system sends multiple paths to peers.
	<b>receive</b>	Enter the keyword <code>receive</code> to indicate that the system accepts multiple paths from peers.
	<b>both</b>	Enter the keyword <code>both</code> to indicate that the system sends and accepts multiple paths from peers.
	<b><i>path-count</i></b>	Enter the number paths supported. The range is from 2 to 64.

**Defaults** Disabled

- Command Modes**
- ROUTER BGP
  - ROUTER BGP-address-family

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.0	Introduced on the Z9000.
8.3.8.0	Introduced on the S4810.

**Related Commands** [neighbor add-path](#) — specifies that this neighbor/peer group can send/receive multiple path advertisements.

## bgp asnotation

Allows you to implement a method for AS number representation in the command line interface (CLI).

### S4820T

**Syntax** `bgp asnotation [asplain | asdot+ | asdot]`  
 To disable a dot or dot+ representation and return to ASPLAIN, enter the `no bgp asnotation` command.

**Defaults** **asplain**

**Command Modes** ROUTER BGP

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced the dynamic application of AS notation changes.
8.2.1.0	Introduced.

## Usage Information

Before enabling this feature, enable the `enable bgp four-octet-as-support` command. If you disable the `four-octet-as-support` command after using `dot` or `dot+` format, the AS numbers revert to `asplain` text.

When you apply an `asnotation`, it is reflected in the `running-configuration`. If you change the notation type, the `running-config` updates dynamically and the new notation shows.

## Example

```
Dell(conf)#router bgp 1
Dell(conf-router_bgp)#bgp asnotation asdot
Dell(conf-router_bgp)#ex
Dell(conf)#do show run | grep bgp

router bgp 1
  bgp four-octet-as-support
  bgp asnotation asdot

Dell(conf)#router bgp 1
Dell(conf-router_bgp)#bgp asnotation asdot+
Dell(conf-router_bgp)#ex

Dell(conf)#do show run | grep bgp
router bgp 1
  bgp four-octet-as-support
  bgp asnotation asdot+

Dell(conf)#router bgp 1
Dell(conf-router_bgp)#bgp asnotation asplain
Dell(conf-router_bgp)#ex
Dell(conf)#do show run |grep bgp
router bgp 1
  bgp four-octet-as-support

Dell(conf)#
```

## Related Commands

[bgp four-octet-as-support](#) — enables 4-byte support for the BGP process.

## bgp bestpath as-path ignore

Ignore the AS PATH in BGP best path calculations.

### S4820T

<b>Syntax</b>	<code>bgp bestpath as-path ignore</code> To return to the default, enter the <code>no bgp bestpath as-path ignore</code> command.																
<b>Defaults</b>	Disabled (that is, the software considers the AS_PATH when choosing a route as best).																
<b>Command Modes</b>	ROUTER BGP																
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .  The following is a list of the Dell Networking OS version history for this command. <table><thead><tr><th>Version</th><th>Description</th></tr></thead><tbody><tr><td>9.7(0.0)</td><td>Introduced on the S6000–ON.</td></tr><tr><td>9.0.2.0</td><td>Introduced on the S6000.</td></tr><tr><td>8.3.19.0</td><td>Introduced on the S4820T.</td></tr><tr><td>8.3.11.1</td><td>Introduced on the Z9000.</td></tr><tr><td>8.3.7.0</td><td>Introduced on the S4810.</td></tr><tr><td>7.8.1.0</td><td>Introduced on the S-Series.</td></tr><tr><td>7.7.1.0</td><td>Introduced on the C-Series.</td></tr></tbody></table>	Version	Description	9.7(0.0)	Introduced on the S6000–ON.	9.0.2.0	Introduced on the S6000.	8.3.19.0	Introduced on the S4820T.	8.3.11.1	Introduced on the Z9000.	8.3.7.0	Introduced on the S4810.	7.8.1.0	Introduced on the S-Series.	7.7.1.0	Introduced on the C-Series.
Version	Description																
9.7(0.0)	Introduced on the S6000–ON.																
9.0.2.0	Introduced on the S6000.																
8.3.19.0	Introduced on the S4820T.																
8.3.11.1	Introduced on the Z9000.																
8.3.7.0	Introduced on the S4810.																
7.8.1.0	Introduced on the S-Series.																
7.7.1.0	Introduced on the C-Series.																
<b>Usage Information</b>	If you enable this command, use the <code>clear ip bgp *</code> command to recompute the best path.																

## bgp bestpath as-path multipath-relax

Include prefixes received from different AS paths during multipath calculation.

<b>Syntax</b>	<code>bgp bestpath as-path multipath-relax</code> To return to the default BGP routing process, use the <code>no bgp bestpath as-path multipath-relax</code> command.
<b>Defaults</b>	Disabled
<b>Command Modes</b>	ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.4	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.

**Usage Information**

The `bestpath router bgp configuration mode` command changes the default bestpath selection algorithm. The `multipath-relax` option allows load-sharing across providers with different (but equal-length) autonomous system paths. Without this option, ECMP expects the AS paths to be identical for load-sharing.

## bgp bestpath med confed

Enable MULTI\_EXIT\_DISC (MED) attribute comparison on paths learned from BGP confederations.

### S8420T

**Syntax**

```
bgp bestpath med confed
```

To disable MED comparison on BGP confederation paths, enter the `no bgp bestpath med confed` command.

**Defaults**

Disabled

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.

Version	Description
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information** The software compares the MEDs only if the path contains no external autonomous system numbers. If you enable this command, use the `clear ip bgp *` command to recompute the best path.

## bgp bestpath med missing-as-best

During path selection, indicate preference to paths with missing MED (MULTI\_EXIT\_DISC) over paths with an advertised MED attribute.

### S4820T

**Syntax** `bgp bestpath med missing-as-best`  
To return to the default selection, use the `no bgp bestpath med missing-as-best` command.

**Defaults** Disabled

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
6.3.1.0	Introduced

**Usage Information** The MED is a 4-byte unsigned integer value and the default behavior is to assume a missing MED as 4294967295. This command causes a missing MED to be treated as 0. During path selection, paths with a lower MED are preferred over paths with a higher MED.

## bgp bestpath router-id ignore

Do not compare router-id information for external paths during best path selection.

### S4820T

<b>Syntax</b>	<code>bgp bestpath router-id ignore</code> To return to the default selection, use the <code>no bgp bestpath router-id ignore</code> command.														
<b>Defaults</b>	Disabled														
<b>Command Modes</b>	ROUTER BGP														
<b>Command History</b>	<p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> <table><thead><tr><th>Version</th><th>Description</th></tr></thead><tbody><tr><td>9.7(0.0)</td><td>Introduced on the S6000–ON.</td></tr><tr><td>9.0.2.0</td><td>Introduced on the S6000.</td></tr><tr><td>8.3.19.0</td><td>Introduced on the S4820T.</td></tr><tr><td>8.3.11.1</td><td>Introduced on the Z9000.</td></tr><tr><td>8.3.7.0</td><td>Introduced on the S4810.</td></tr><tr><td>8.3.1.0</td><td>Introduced</td></tr></tbody></table>	Version	Description	9.7(0.0)	Introduced on the S6000–ON.	9.0.2.0	Introduced on the S6000.	8.3.19.0	Introduced on the S4820T.	8.3.11.1	Introduced on the Z9000.	8.3.7.0	Introduced on the S4810.	8.3.1.0	Introduced
Version	Description														
9.7(0.0)	Introduced on the S6000–ON.														
9.0.2.0	Introduced on the S6000.														
8.3.19.0	Introduced on the S4820T.														
8.3.11.1	Introduced on the Z9000.														
8.3.7.0	Introduced on the S4810.														
8.3.1.0	Introduced														
<b>Usage Information</b>	Configuring this option retains the current best-path. When sessions are then reset, the oldest received path is chosen as the best-path.														

## bgp client-to-client reflection

Allows you to enable route reflection between clients in a cluster.

<b>Syntax</b>	<code>bgp client-to-client reflection</code> To disable client-to-client reflection, use the <code>no bgp client-to-client reflection</code> command.
<b>Defaults</b>	Enabled when a route reflector is configured.
<b>Command Modes</b>	ROUTER BGP

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

## Usage Information

Route reflection to clients is not necessary if all client routers are fully meshed.

## Related Commands

[bgp cluster-id](#) — assigns an ID to a BGP cluster with two or more route reflectors.

[neighbor route-reflector-client](#) — configures a route reflector and clients.

## bgp cluster-id

Assign a cluster ID to a BGP cluster with more than one route reflector.

### S4820T

#### Syntax

```
bgp cluster-id {ip-address | number}
```

To delete a cluster ID, use the `no bgp cluster-id {ip-address | number}` command.

#### Parameters

<i>ip-address</i>	Enter an IP address as the route reflector cluster ID.
<i>number</i>	Enter a route reflector cluster ID as a number from 1 to 4294967295.

#### Defaults

Not configured.

#### Command Modes

ROUTER BGP

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

### Usage Information

When a BGP cluster contains only one route reflector, the cluster ID is the route reflector's router ID. For redundancy, a BGP cluster may contain two or more route reflectors. Assign a cluster ID with the `bgp cluster-id` command. Without a cluster ID, the route reflector cannot recognize route updates from the other route reflectors within the cluster.

The default format for displaying the cluster-id is dotted decimal, but if you enter the cluster-id as an integer, it is displayed as an integer.

This command automatically restarts the BGP instance for the configuration to take effect.

### Related Commands

[bgp client-to-client reflection](#) — enables route reflection between the route reflector and clients.

[neighbor route-reflector-client](#) — configures a route reflector and clients.

[show ip bgp cluster-list](#) — views paths with a cluster ID.

## bgp confederation identifier

Configure an identifier for a BGP confederation.

### S4820T

#### Syntax

```
bgp confederation identifier as-number
```

To delete a BGP confederation identifier, use the `no bgp confederation identifier as-number` command.

#### Parameters

***as-number***

Enter the AS number. The range is from 0 to 65535 (2 byte), from 1 to 4294967295 (4 byte), or from 0.1 to 65535.65535 (dotted format).

#### Defaults

Not configured.

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series. Added support for the 4-byte format

**Usage Information**

To accept 4-byte formats before entering a 4-byte AS number, configure your system. All the routers in the Confederation must be 4 byte or 2 byte identified routers. You cannot mix them.

The autonomous systems configured in this command are visible to the EBGp neighbors. Each autonomous system is fully meshed and contains a few connections to other autonomous systems. The next hop, MED, and local preference information is preserved throughout the confederation.

Dell Networking OS accepts confederation EBGp peers without a LOCAL\_PREF attribute. The software sends AS\_CONFED\_SET and accepts AS\_CONFED\_SET and AS\_CONF\_SEQ.

If a local-as is configured, BGP does not allow for the configuration of BGP confederation. Similarly, if BGP confederation is configured, then BGP does not allow the configuration of local-as.

If the neighbor is an eBGp neighbor, then BGP performs a check on the first AS number. In this scenario, it is mandatory that the first sequence in the AS path is of type AS\_SEQUENCE or AS\_CONFED\_SEQUENCE (in the case of confederations). If the first entry appears as an AS\_CONFED\_SET and the neighbor is not in the local AS, then this is strictly a problem with the neighbor node.

This command automatically restarts the BGP instance for the configuration to take effect.

**Related Commands**

[bgp four-octet-as-support](#) — enables 4-byte support for the BGP process.

## bgp confederation peers

Specify the autonomous systems (ASs) that belong to the BGP confederation.

### S4820T

<b>Syntax</b>	<code>bgp confederation peers as-number [...as-number]</code> To return to the default, use the <code>no bgp confederation peers</code> command.																
<b>Parameters</b>	<table><tr><td><b>as-number</b></td><td>Enter the AS number. The range is from 0 to 65535 (2 byte), from 1 to 4294967295 (4 byte), or from 0.1 to 65535.65535 (dotted format).</td></tr><tr><td><b>...as-number</b></td><td>(OPTIONAL) Enter up to 16 confederation numbers. The range is from 0 to 65535 (2 byte), from 1 to 4294967295 (4 byte), or from 0.1 to 65535.65535 (dotted format).</td></tr></table>	<b>as-number</b>	Enter the AS number. The range is from 0 to 65535 (2 byte), from 1 to 4294967295 (4 byte), or from 0.1 to 65535.65535 (dotted format).	<b>...as-number</b>	(OPTIONAL) Enter up to 16 confederation numbers. The range is from 0 to 65535 (2 byte), from 1 to 4294967295 (4 byte), or from 0.1 to 65535.65535 (dotted format).												
<b>as-number</b>	Enter the AS number. The range is from 0 to 65535 (2 byte), from 1 to 4294967295 (4 byte), or from 0.1 to 65535.65535 (dotted format).																
<b>...as-number</b>	(OPTIONAL) Enter up to 16 confederation numbers. The range is from 0 to 65535 (2 byte), from 1 to 4294967295 (4 byte), or from 0.1 to 65535.65535 (dotted format).																
<b>Defaults</b>	Not configured.

Related  
Commands

[bgp confederation identifier](#) — configures a confederation ID.

[bgp four-octet-as-support](#) — enables 4-byte support for the BGP process.

## bgp dampening

Enable BGP route dampening and configure the dampening parameters.

### S4820T

Syntax

```
bgp dampening [half-life reuse suppress max-suppress-time]  
[route-map map-name]
```

To disable route dampening, use the `no bgp dampening [half-life reuse suppress max-suppress-time] [route-map map-name]` command.

Parameters

<b><i>half-life</i></b>	(OPTIONAL) Enter the number of minutes after which the Penalty is decreased. After the router assigns a Penalty of 1024 to a route, the Penalty is decreased by half after the half-life period expires. The range is from 1 to 45. The default is <b>15 minutes</b> .
<b><i>reuse</i></b>	(OPTIONAL) Enter a number as the reuse value, which is compared to the flapping route's Penalty value. If the Penalty value is less than the reuse value, the flapping route is once again advertised (or no longer suppressed). The range is from 1 to 20000. The default is <b>750</b> .
<b><i>suppress</i></b>	(OPTIONAL) Enter a number as the suppress value, which is compared to the flapping route's Penalty value. If the Penalty value is greater than the suppress value, the flapping route is no longer advertised (that is, it is suppressed). The range is from 1 to 20000. The default is <b>2000</b> .
<b><i>max-suppress-time</i></b>	(OPTIONAL) Enter the maximum number of minutes a route can be suppressed. The default is four times the half-life value. The range is from 1 to 255. The default is <b>60 minutes</b> .
<b><i>route-map map-name</i></b>	(OPTIONAL) Enter the keyword <code>route-map</code> then the name of a configured route map.  Only <code>match</code> commands in the configured route map are supported.

Defaults

Disabled.

Command  
Modes

- ROUTER BGP
- ROUTER BGP-address-family

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

## Usage Information

If you enter the `bgp dampening` command, the default values for *half-life*, *reuse*, *suppress*, and *max-suppress-time* are applied. The parameters are position-dependent; therefore, if you configure one parameter, configure the parameters in the order they appear in the CLI.

Route refresh is sent when you enable BGP dampening.

## Related Commands

[show ip bgp dampened-paths](#) — views the BGP paths.

## bgp default local-preference

Change the default local preference value for routes exchanged between internal BGP peers.

### Syntax

```
bgp default local-preference value
```

To return to the default value, use the `no bgp default local-preference` command.

### Parameters

***value***

Enter a number to assign to routes as the degree of preference for those routes. When routes are compared, the higher the degree of preference or local preference value, the more the route is preferred. The range is from 0 to 4294967295. The default is **100**.

### Defaults

**100**

### Command Modes

ROUTER BGP

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

## Usage Information

All routers apply the `bgp default local-preference` command setting within the AS. To set the local preference for a specific route, use the `set local-preference` command in ROUTE-MAP mode.

## Related Commands

[set local-preference](#) — assigns a local preference value for a specific route.

## bgp dmzlink-bw

Enables BGP Link Bandwidth.

### S4820T

#### Syntax

```
bgp dmzlink-bw
```

To disable BGP Link Bandwidth, enter the `no bgp dmzlink-bw` command.

#### Parameters

<b>dmzlink-bw</b>	Enter the keyword <code>dmzlink-bw</code> to enable BGP Link Bandwidth in BGP multipath.
-------------------	--

#### Defaults

N/A

#### Command Modes

ROUTER BGP

#### Command History

Version	Description
9.7(0.0)	Introduced on the S-Series.

## Usage Information

Configuring or un-configuring the command will bring down and bring up the BGP Route Manager, this will result in tear down and re-establishment of all active sessions.

Link Bandwidth has to be configured on the router in order to tell it to associate Link Bandwidth with prefixes (paths) and/or to use Link Bandwidth in BGP Multipath route selection.

This is done under BGP configuration and is supported per address family – for IPv4 and IPv6 address families.

The configuration for a particular address family will apply across all VRFs configured.

This command must be performed on the router which is attaching link bandwidth to prefixes (typically a border router) as well as the router which is expected to load share traffic proportional to the bandwidth of the external links.

## bgp enforce-first-as

Disable (or enable) enforce-first-as check for updates received from EBGp peers.

### S4820T

#### Syntax

```
bgp enforce-first-as
```

To turn off the default, use the `no bgp enforce-first-as` command.

#### Defaults

Enabled

#### Command Modes

ROUTER BGP

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Version	Description
7.4.1.0	Introduced.

#### Usage Information

This command is enabled by default, that is for all updates received from EBGp peers, BGP ensures that the first AS of the first AS segment is always the AS of the peer. If not, the update is dropped and a counter is increments. Use the `show ip bgp neighbors` command to view the “failed enforce-first-as check” counter.

If you disable the `enforce-first-as` command, it can be viewed using the `show ip protocols` command.

In the event of an enforce-first-as check failure, the existing BGP session is flapped.

#### Related Commands

[show ip bgp neighbors](#) — views the information the BGP neighbors exchange.

[show ip protocols](#) — views information on routing protocols.

## bgp fast-external-fallover

Enable the fast external fallover feature, which immediately resets the BGP session if a link to a directly connected external peer fails.

### S4820T

#### Syntax

```
bgp fast-external-fallover
```

To disable fast external fallover, use the `no bgp fast-external-fallover` command.

#### Defaults

Enabled

#### Command Modes

ROUTER BGP

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.

Version	Description
7.7.1.0	Introduced on the C-Series.

**Usage Information**

The `bgp fast-external-fallover` command appears in the `show config` command output.

The fast external fallover configuration is applied only after you manually reset all the existing BGP sessions. As a result, after you execute this command, you must also manually execute the `clear ip bgp` command in order for the configuration to take effect.

## bgp four-octet-as-support

Enable 4-byte support for the BGP process.

### S4820T

**Syntax**

`bgp four-octet-as-support`

To disable fast external failover, use the `no bgp four-octet-as-support` command.

**Defaults**

Disabled (supports 2-byte format)

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information**

Routers supporting 4-byte ASNs advertise that function in the OPEN message. The behavior of a 4-byte router is slightly different depending on whether it is speaking to a 2-byte router or a 4-byte router.

When creating Confederations, all the routers in the Confederation must be 4 byte or 2 byte identified routers. You cannot mix them.

Where the 2-byte format is from 1 to 65535, the 4-byte format is from 1 to 4294967295. Both formats are accepted and the advertisements reflect the entered format.

For more information about using the 2 byte or 4-byte format, refer to the *Dell Networking OS Configuration Guide*.

This command automatically restarts the BGP instance for the configuration to take effect.

## bgp graceful-restart

To support graceful restart as a receiver only, enable graceful restart on a BGP neighbor, a BGP node, or designate a local router.

### S4820T

**Syntax** `bgp graceful-restart [restart-time seconds] [stale-path-time seconds] [role receiver-only]`

To return to the default, use the `no bgp graceful-restart` command.

#### Parameters

<b>restart-time seconds</b>	Enter the keyword <code>restart-time</code> then the maximum number of seconds to restart and bring-up all the peers. The range is from 1 to 3600 seconds. The default is <b>120 seconds</b> .
<b>stale-path-time seconds</b>	Enter the keyword <code>stale-path-time</code> then the maximum number of seconds to wait before restarting a peer's stale paths. The default is <b>360 seconds</b> .
<b>role receiver-only</b>	Enter the keyword <code>role receiver-only</code> to designate the local router to support graceful restart as a receiver only.

**Defaults** as above

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information**

This feature is advertised to BGP neighbors through a capability advertisement. In Receiver Only mode, BGP saves the advertised routes of peers that support this capability when they restart.

BGP graceful restart is active only when the neighbor becomes established. Otherwise it is disabled. Graceful-restart applies to all neighbors with established adjacency.

This command automatically restarts the BGP instance for the configuration to take effect.

## bgp non-deterministic-med

Compare MEDs of paths from different autonomous systems.

<b>Syntax</b>	<code>bgp non-deterministic-med</code> To return to the default, use the <code>no bgp non-deterministic-med</code> command.
<b>Defaults</b>	Disabled (that is, paths/routes for the same destination but from different ASs do not have their MEDs compared).
<b>Command Modes</b>	ROUTER BGP
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.

Version	Description
7.7.1.0	Introduced on the C-Series.

**Usage Information**

In Non-Deterministic mode, paths are compared in the order in which they arrive. This method can lead to Dell Networking OS choosing different best paths from a set of paths, depending on the order in which they are received from the neighbors because MED may or may not get compared between adjacent paths. In Deterministic mode (`no bgp non-deterministic-med`), Dell Networking OS compares MED between adjacent paths within an AS group because all paths in the AS group are from the same AS.

When you change the path selection from Deterministic to Non-Deterministic, the path selection for the existing paths remains Deterministic until you enter the `clear ip bgp` command to clear existing paths.

## bgp recursive-bgp-next-hop

Enable next-hop resolution through other routes learned by BGP.

### S4820T

**Syntax** `bgp recursive-bgp-next-hop`  
To disable next-hop resolution, use the `no bgp recursive-bgp-next-hop` command.

**Defaults** Enabled

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.2.1.0	Introduced.

**Usage Information**

This command is a *knob* to disable BGP next-hop resolution using BGP learned routes. During the next-hop resolution, only the first route that the next-hop resolves through is verified for the route's protocol source and is checked if the route is learned from BGP or not.

The `clear ip bgp` command is required for this command to take effect and to keep the BGP database consistent. Execute the `clear ip bgp` command right after executing this command.

**Related Commands**

[clear ip bgp](#) — clears the ip bgp.

## bgp regex-eval-optz-disable

Disables the Regex Performance engine that optimizes complex regular expression with BGP.

### S4820T

**Syntax**

`bgp regex-eval-optz-disable`

To re-enable optimization engine, use the `no bgp regex-eval-optz-disable` command.

**Defaults**

Enabled

**Command Modes**

ROUTER BGP (conf-router\_bgp)

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.6.1.0	Introduced

**Usage Information**

BGP uses regular expressions (regex) to filter route information. In particular, the use of regular expressions to filter routes based on AS-PATHs and communities is common. In a large-scale configuration, filtering millions of routes based on

regular expressions can be quite CPU intensive, as a regular expression evaluation involves generation and evaluation of complex finite state machines.

BGP policies, containing regular expressions to match as-path and communities, tend to use much CPU processing time, which in turn affects the BGP routing convergence. Additionally, the `show bgp` commands, which are filtered through regular expressions, use up CPU cycles particularly with large databases. The Regex Engine Performance Enhancement feature optimizes the CPU usage by caching and reusing regular expression evaluation results. This caching and reuse may be at the expensive of RP1 processor memory.

### Examples

```
Dell(conf-router_bgp)#no bgp regex-eval-optz-disable
Dell(conf-router_bgp)#do show ip protocols
Routing Protocol is "ospf 22222"
  Router ID is 2.2.2.2
  Area          Routing for Networks
  51            10.10.10.0/00

Routing Protocol is "bgp 1"
  Cluster Id is set to 10.10.10.0
  Router Id is set to 10.10.10.0
  Fast-external-fallover enabled
Regular expression evaluation optimization enabled
Capable of ROUTE_REFRESH
For Address Family IPv4 Unicast
  BGP table version is 0, main routing table version 0
  Distance: external 20 internal 200 local 200

Dell(conf-router_bgp)#
```

### Related Commands

[show ip protocols](#) — views information on all routing protocols enabled and active on the E-Series.

## bgp router-id

Assign a user-given ID to a BGP router.

### S4820T

#### Syntax

```
bgp router-id ip-address
```

To delete a user-assigned IP address, use the `no bgp router-id` command.

#### Parameters

***ip-address*** Enter an IP address in dotted decimal format to reset only that BGP neighbor.

#### Defaults

The router ID is the highest IP address of the Loopback interface or, if no Loopback interfaces are configured, the highest IP address of a physical interface on the router.

#### Command Modes

ROUTER BGP

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

## Usage Information

Peering sessions are reset when you change the router ID of a BGP router.

This command automatically restarts the BGP instance for the configuration to take effect.

## clear ip bgp

Reset BGP sessions. The soft parameter (BGP Soft Reconfiguration) clears the policies without resetting the TCP connection.

### S4820T

#### Syntax

```
clear ip bgp [vrf vrf-name] [* | <1-4294967295> | <0.1-65535.65535> | A.B.C.D {soft {in | out}} | X:X:X:X:X {soft {in | out}} | dampening | flap-statistics | ipv4 | ipv6 | peer-group]
```

#### Parameters

<b>vrf vrf-name</b>	Enter the keyword <code>vrf</code> and then the name of the VRF to clear all BGP sessions corresponding to that VRF.
	<b>NOTE:</b> Use this attribute to clear a BGP instance corresponding to either a specific address family in a default VRF or an IPv4 address family in a non-default VRF.
<b>*</b>	Enter an asterisk ( <code>*</code> ) to reset all BGP sessions.
<b>&lt;1-4294967295&gt;</b>	Enter <code>&lt;1-4294967295&gt;</code> to clear peers with the AS number.
<b>&lt;0.1-65535.65535&gt;</b>	Enter <code>&lt;0.1-65535.65535&gt;</code> to clear peers with the AS number in dot format.

<b>A.B.C.D</b>	Enter the BGP neighbor address in the A.B.C.D format to clear.
<b>X:X:X:X::X</b>	Enter the BGP neighbor address in the X:X:X:X::X format to clear.
<b>soft</b>	(OPTIONAL) Enter the keyword <code>soft</code> to configure and activate policies without resetting the BGP TCP session, that is, BGP Soft Reconfiguration.
	 <b>NOTE:</b> If you enter the <code>clear ip bgp ip-address soft</code> command, both inbound and outbound policies are reset.
<b>in</b>	(OPTIONAL) Enter the keyword <code>in</code> to activate only inbound policies.
<b>out</b>	(OPTIONAL) Enter the keyword <code>out</code> to activate only outbound policies.
	 <b>NOTE:</b> You must execute the <code>clear ip bgp soft out</code> command when ever there is a change in the local policy. If you do not run this command after a local policy change, then these policy changes are not reflected in the responses to the peer's route refresh messages.
<b>dampening</b>	Enter the keyword <code>dampening</code> to clear the flap dampening information.
<b>flap-statistics</b>	Enter the keywords <code>flap-statistics</code> to clear the flap statistics information.
<b>ipv4</b>	Enter the ipv4 address family to clear.
<b>ipv6</b>	Enter the ipv6 address family to clear.
<b>peer-group</b>	Enter the peer-group to clear all members of the peer-group.

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.4.(0.0)	Added support for VRF.
9.0.2.0	Introduced on the S6000.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
6.5.1.0	Expanded to include the <code>as-number</code> option.

**Related Commands** [bgp recursive-bgp-next-hop](#) — disables next-hop resolution through other routes learned by the BGP.

## clear ip bgp dampening

Clear information on route dampening and return the suppressed route to the Active state.

### S4820T

**Syntax** `clear ip bgp [vrf vrf-name] [ipv4 [multicast | unicast] | ipv6 unicast] [dampening [ipv4-address mask | ipv6-address mask]]`

#### Parameters

<b>vrf vrf-name</b>	(OPTIONAL) Enter the keyword <code>vrf</code> and then the name of the VRF to clear information on route dampening corresponding to that VRF
	 <b>NOTE:</b> You can use this attribute on a specific VRF to remove history routes corresponding to that VRF. You can also use this attribute to return the suppressed routes corresponding to a specific VRF to an active state.
<b>ipv4 multicast</b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to clear the ipv4 multicast routes.
<b>ipv4 unicast</b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>unicast</code> to clear the ipv4 unicast routes.
<b>ipv6 unicast</b>	(OPTIONAL) Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to clear the ipv6 unicast routes.
<b>ipv4-address mask</b>	(OPTIONAL) Enter an IPv4 address in dotted decimal format and the prefix mask in slash format (/x) to clear dampening information only that BGP neighbor.
<b>ipv6-address mask</b>	(OPTIONAL) Enter the IPv6 address and the network mask to clear information on IPv6 route dampening.

**Command Modes** EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Added the ipv4 multicast and ipv6 unicast parameters.
9.4.(0.0)	Added support for VRF.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

## Usage Information

After you enter this command, the software deletes the history routes and returns the suppressed routes to the Active state.

The `clear ip bgp dampening` command does not clear the history paths.

## clear ip bgp flap-statistics

Clear BGP flap statistics, which includes number of flaps and the time of the last flap.

### S4820T

#### Syntax

```
clear ip bgp [vrf vrf-name] [ipv4 [multicast | unicast] | ipv6 unicast] [flap-statistics [ipv4-address mask | ipv6-address mask] | filter-list as-path-name | regexp regular-expression]
```

#### Parameters

**vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` and then the name of the VRF to clear BGP flap statistics corresponding to that VRF.

**NOTE:** You can use this attribute on a specific VRF to remove history routes corresponding to that VRF. You can also use this attribute to return the suppressed routes corresponding to a specific VRF to an active state.

**ipv4 multicast** (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `multicast` to clear information related only to ipv4 multicast routes.

**ipv4 unicast** (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `unicast` to clear information related only to ipv4 unicast routes.

<b>ipv6 unicast</b>	(OPTIONAL) Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to clear information related only to ipv6 unicast routes.
<b>ipv4-address mask</b>	(OPTIONAL) Enter an IPv4 address in dotted decimal format and the prefix mask in slash format (/x) to reset only that prefix.
<b>ipv6-address mask</b>	(OPTIONAL) Enter the IPv6 address followed by the network mask to reset only that prefix.
<b>filter-list as-path-name</b>	(OPTIONAL) Enter the keywords <code>filter-list</code> then the name of a configured AS-PATH list.
<b>regexp regular-expression</b>	<p>(OPTIONAL) Enter the keyword <code>regexp</code> then regular expressions. Use one or a combination of the following:</p> <ul style="list-style-type: none"> <li>• <code>.</code> = (period) any single character (including a white space).</li> <li>• <code>*</code> = (asterisk) the sequences in a pattern (0 or more sequences).</li> <li>• <code>+</code> = (plus) the sequences in a pattern (1 or more sequences).</li> <li>• <code>?</code> = (question mark) sequences in a pattern (either 0 or 1 sequences).</li> </ul> <p> <b>NOTE:</b> Enter an escape sequence (CTRL+v) prior to entering the <code>?</code> regular expression.</p> <ul style="list-style-type: none"> <li>• <code>[ ]</code> = (brackets) a range of single-character patterns.</li> <li>• <code>( )</code> = (parenthesis) groups a series of pattern elements to a single element.</li> <li>• <code>{ }</code> = (braces) minimum and the maximum match count.</li> <li>• <code>^</code> = (caret) the beginning of the input string. If you use the caret at the beginning of a sequence or range, it matches on everything BUT the characters specified.</li> <li>• <code>\$</code> = (dollar sign) the end of the output string.</li> </ul>

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

<b>Version</b>	<b>Description</b>
<b>9.7(0.0)</b>	Added the ipv4 multicast and ipv6 unicast parameters.
<b>9.4.(0.0)</b>	Added support for VRF.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.

Version	Description
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information** If you enter the `clear ip bgp flap-statistics` command without any parameters, all statistics are cleared.

**Related Commands** [show debugging](#) — views the enabled debugging operations.

[show ip bgp flap-statistics](#) — views the BGP flap statistics.

[undebug all](#) — disables all debugging operations.

## clear ip bgp peer-group

Reset a peer-group's BGP sessions.

### S4820T

**Syntax** `clear ip bgp [vrf vrf-name] peer-group peer-group-name [ipv4 [multicast | unicast] | ipv6 unicast] [soft {in | out}]`

Parameters	
<b>vrf vrf-name</b>	Enter the keyword <code>vrf</code> and then the name of the VRF to reset the peer group corresponding to that VRF.   <b>NOTE:</b> You can use this attribute on a specific VRF to remove history routes corresponding to that VRF. You can also use this attribute to return the suppressed routes corresponding to a specific VRF to an active state.
<b>peer-group-name</b>	Enter the peer group name to reset the BGP sessions within that peer group.
<b>ipv4 multicast</b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to reset ipv4 multicast routes.
<b>ipv4 unicast</b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>unicast</code> to reset ipv4 unicast routes.
<b>ipv6 unicast</b>	(OPTIONAL) Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to reset ipv6 unicast routes.
<b>soft</b>	(OPTIONAL) Enter the keyword <code>soft</code> to reset soft configuration.
<b>in</b>	Enter the keyword <code>in</code> to re-configure soft inbound updates.
<b>out</b>	Enter the keyword <code>out</code> to re-configure soft outbound updates.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Added the ipv4 multicast and ipv6 unicast parameters.
9.4(0.0)	Added support for VRF.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

## debug ip bgp

Display all information on BGP, including BGP events, keepalives, notifications, and updates.

### S4820T

**Syntax**

```
debug ip bgp [ vrf vrf-name | A.B.C.D | X:X:X:X::X | peer-group peer-group-name ] [ in | out ]
```

To disable all BGP debugging, use the `no debug ip bgp` command.

**Parameters**

**vrf vrf-name**

Enter the keyword `vrf` and then the name of the VRF to debug BGP information corresponding to that VRF.

**NOTE:** Use this attribute to debug BGP protocol operations corresponding to either a default or non-default VRF.

**A.B.C.D**

Enter the IPv4 address of the neighbor in dotted decimal format.

**X:X:X:X::X**

(OPTIONAL) Enter an IPv6 address.

**peer-group peer-group-name**

Enter the keywords `peer-group` then the name of the peer group to debug.

**in**

(OPTIONAL) Enter the keyword `in` to view only information on inbound BGP routes.

**out**

(OPTIONAL) Enter the keyword `out` to view only information on outbound BGP routes.

<b>A.B.C.D</b>	Enter the IP address of peer in the A.B.C.D format.
<b>X:X:X:X::X</b>	Enter the IPv6 IP address of peer in the X:X:X:X::X format.
<b>dampening</b>	Enter the keyword <code>dampening</code> to view BGP dampening.
<b>events</b>	Enter the keyword <code>events</code> to view BGP protocol events.
<b>ipv4</b>	Enter the ipv4 IP address to view the IPV4 route information.
<b>ipv6</b>	Enter the ipv6 IP address to view the IPV6 route information.
<b>keepalives</b>	Enter the keyword <code>keepalives</code> to view BGP keepalives.
<b>notifications</b>	Enter the keyword <code>notifications</code> to view BGP notifications.
<b>soft-reconfiguration</b>	Enter the keywords <code>soft-reconfiguration</code> to view only information on inbound BGP soft reconfiguration.
<b>updates</b>	Enter the keyword <code>updates</code> to view BGP updates.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

<b>Version</b>	<b>Description</b>
<b>9.7(0.0)</b>	Introduced on the S6000–ON.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>9.4.(0.0)</b>	Added support for VRF.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.8.1.0</b>	Introduced on the S-Series.
<b>7.7.1.0</b>	Introduced on the C-Series.

**Usage Information**

To view information on both incoming and outgoing routes, do not include the `in` and `out` parameters in the debugging command. The `in` and `out` parameters cancel each other; for example, if you enter the `debug ip bgp in` command and then enter the `debug ip bgp out` command, you do not see information on the incoming routes.

Entering a `no debug ip bgp` command removes all configured debug commands for BGP.

## Related Commands

[debug ip bgp notifications](#) — views information about BGP notifications.

[debug ip bgp updates](#) — views information about BGP updates.

[show debugging](#) — views enabled debugging operations.

## debug ip bgp dampening

View information on routes being dampened.

### S4820T

#### Syntax

```
debug ip bgp [vrf vrf-name] [ipv4 {unicast | multicast} | ipv6 unicast] dampening
```

To disable debugging, use the `no debug ip bgp dampening` command.

#### Parameters

<b>vrf vrf-name</b>	Enter the keyword <code>vrf</code> followed by the name of the VRF to view information on dampened routes corresponding to that VRF.
<b>ipv4 multicast</b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to view dampened-route information related only to ipv4 multicast routes.
<b>ipv4 unicast</b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to view dampened-route information related only to ipv4 unicast routes.
<b>ipv6 unicast</b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>unicast</code> to view dampened-route information related only to ipv6 unicast routes.

EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

b

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.6.1.0	Introduced IPv6 MGBP support for the E-Series.

## debug ip bgp events

Display information on local BGP state changes and other BGP events.

### S4820T

#### Syntax

```
debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X:X::X | peer-group peer-group-name] events [in | out]
```

To disable debugging, use the `no debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X:X::X | peer-group peer-group-name] events [in | out]` command.

#### Parameters

<b><i>vrf vrf-name</i></b>	(OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to display BGP state changes corresponding to that VRF.
<b><i>A.B.C.D</i></b>	(OPTIONAL) Enter the IPv4 address of the neighbor.
<b><i>X:X:X:X::X</i></b>	(OPTIONAL) Enter an IPv6 address.
<b><i>peer-group peer-group-name</i></b>	(OPTIONAL) Enter the keyword <code>peer-group</code> then the name of the peer group.
<b><i>in</i></b>	(OPTIONAL) Enter the keyword <code>in</code> to view only events on inbound BGP messages.
<b><i>out</i></b>	(OPTIONAL) Enter the keyword <code>out</code> to view only events on outbound BGP messages.

EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information** To remove all configured debug commands for BGP, enter the `no debug ip bgp` command.

## debug ip bgp keepalives

Display information about BGP keepalive messages.

### S4820T

**Syntax** `debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X:X::X | peer-group peer-group-name] keepalives [in | out]`  
 To disable debugging, use the `no debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X:X::X | peer-group peer-group-name] keepalives [in | out]` command.

### Parameters

<b>vrf vrf-name</b>	(OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to display BGP keepalive information corresponding to that VRF.
<b>A.B.C.D</b>	(OPTIONAL) Enter the IPv4 address of the neighbor.
<b>X:X:X:X::X</b>	(OPTIONAL) Enter an IPv6 address.
<b>peer-group peer-group-name</b>	(OPTIONAL) Enter the keyword <code>peer-group</code> then the name of the peer group.
<b>in</b>	(OPTIONAL) Enter the keyword <code>in</code> to view only inbound keepalive messages.
<b>out</b>	(OPTIONAL) Enter the keyword <code>out</code> to view only outbound keepalive messages.

**Command Modes** EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Added the ipv4 multicast and ipv6 unicast parameters.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

## Usage Information

To remove all configured debug commands for BGP, enter the `no debug ip bgp` command.

## debug ip bgp notifications

Allows you to view information about BGP notifications received from neighbors.

### S4820T

#### Syntax

```
debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X:X::X | peer-group peer-group-name] notifications [in | out]
```

To disable debugging, use the `no debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X:X::X | peer-group peer-group-name] notifications [in | out]` command.

#### Parameters

<b>vrf vrf-name</b>	(OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to view neighbor BGP notification information corresponding to that VRF.
<b>A.B.C.D</b>	(OPTIONAL) Enter the IPv4 address of the neighbor.
<b>X:X:X:X::X</b>	(OPTIONAL) Enter an IPv6 address.
<b>peer-group peer-group-name</b>	(OPTIONAL) Enter the keyword <code>peer-group</code> then the name of the peer group.
<b>in</b>	(OPTIONAL) Enter the keyword <code>in</code> to view BGP notifications received from neighbors.
<b>out</b>	(OPTIONAL) Enter the keyword <code>out</code> to view BGP notifications sent to neighbors.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Added ipv6 support.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information** To remove all configured debug commands for BGP, enter the `no debug ip bgp` command.

## debug ip bgp soft-reconfiguration

Enable soft-reconfiguration debug.

### S4820T

**Syntax** `debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X:X::X | peer-group-name] soft-reconfiguration`

To disable, use the `debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X:X::X | peer-group-name] soft-reconfiguration` command.

### Parameters

<b>vrf vrf-name</b>	(OPTIONAL) Enter the keyword vrf followed by the name of the VRF to enable soft-reconfiguration debugging on that VRF.
<b>A.B.C.D</b>	(OPTIONAL) Enter the IPv4 address of the neighbor in dotted decimal format.
<b>X:X:X:X::X</b>	(OPTIONAL) Enter an IPv6 address.
<b>peer-group-name</b>	(OPTIONAL) Enter the name of the peer group to disable or enable all routers within the peer group..

**Defaults** Disabled

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Added support for VRF.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.2.1.0	Introduced.

**Usage Information** This command turns on BGP soft-reconfiguration inbound debugging. If no neighbor is specified, debug turns on for all neighbors.

## debug ip bgp updates

Allows you to view information about BGP updates.

### S4820T

**Syntax** `debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X:X::X | peer-group peer-group-name] updates [in | out | prefix-list prefix-list-name]`

To disable debugging, use the `no debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X:X::X | peer-group peer-group-name] updates [in | out | prefix-list prefix-list-name]` command.

**Parameters**

<b>vrf vrf-name</b>	(OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to view BGP updates information corresponding to that VRF.
<b>A.B.C.D</b>	(OPTIONAL) Enter an IPv4 address of the neighbor.
<b>X:X:X:X::X</b>	(OPTIONAL) Enter an IPv6 address.
<b>peer-group peer-group-name</b>	(OPTIONAL) Enter the keyword <code>peer-group</code> followed by the name of the peer group.

<b>in</b>	(OPTIONAL) Enter the keyword <code>in</code> to view only BGP updates received from neighbors.
<b>out</b>	(OPTIONAL) Enter the keyword <code>out</code> to view only BGP updates sent to neighbors.
<b>prefix-list prefix-list- name</b>	(OPTIONAL) Enter the keyword <code>prefix-list</code> then the name of an established prefix list. If the prefix list is not configured, the default is <b>permit</b> (to allow all routes).
<b>ip-address</b>	(OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.
<b>peer-group- name</b>	(OPTIONAL) Enter the name of the peer group to disable or enable all routers within the peer group.

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Added support for VRF.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information**

To remove all configured debug commands for BGP, enter the `no debug ip bgp` command.

## default-metric

Allows you to change the metric of redistributed routes to locally originated routes. Use this command with the `redistribute` command.

### S4820T

**Syntax**

`default-metric number`

To return to the default setting, use the `no default-metric` command.

<b>Parameters</b>	<i>number</i>	Enter a number as the metric to be assigned to routes from other protocols. The range is from 1 to 4294967295.
<b>Defaults</b>	<b>0</b>	
<b>Command Modes</b>	ROUTER BGP	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .	

The following is a list of the Dell Networking OS version history for this command.

<b>Version</b>	<b>Description</b>
<b>9.7(0.0)</b>	Introduced on the S6000–ON.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.8.1.0</b>	Introduced on the S-Series.
<b>7.7.1.0</b>	Introduced on the C-Series.

<b>Usage Information</b>	The <code>default-metric</code> command in BGP sets the value of the BGP MULTI_EXIT_DISC (MED) attribute for redistributed routes only.
--------------------------	---

<b>Related Commands</b>	<a href="#">bgp always-compare-med</a> — enables comparison of all BGP MED attributes. <a href="#">redistribute</a> — redistributes routes from other routing protocols into BGP.

9.7(0.0)	Introduced on the S-Series.

**Related Commands** [permit bandwidth](#) – specify link band width extended-community attribute as the matching criteria to permitting incoming or outgoing traffic..

## maximum-paths

Configure the maximum number of parallel routes (multipath support) BGP supports.

### S4820T

<b>Syntax</b>	<code>maximum-paths {ebgp   ibgp} number</code> To return to the default values, enter the <code>no maximum-paths</code> command.																		
<b>Parameters</b>	<table><tr><td><b>ebgp</b></td><td>Enter the keyword <code>ebgp</code> to enable multipath support for External BGP routes.</td></tr><tr><td><b>ibgp</b></td><td>Enter the keyword <code>ibgp</code> to enable multipath support for Internal BGP routes.</td></tr><tr><td><b>number</b></td><td>Enter a number as the maximum number of parallel paths. The range is from 2 to 64.</td></tr></table>	<b>ebgp</b>	Enter the keyword <code>ebgp</code> to enable multipath support for External BGP routes.	<b>ibgp</b>	Enter the keyword <code>ibgp</code> to enable multipath support for Internal BGP routes.	<b>number</b>	Enter a number as the maximum number of parallel paths. The range is from 2 to 64.												
<b>ebgp</b>	Enter the keyword <code>ebgp</code> to enable multipath support for External BGP routes.																		
<b>ibgp</b>	Enter the keyword <code>ibgp</code> to enable multipath support for Internal BGP routes.																		
<b>number</b>	Enter a number as the maximum number of parallel paths. The range is from 2 to 64.																		
<b>Defaults</b>	none																		
<b>Command Modes</b>	ROUTER BGP																		
<b>Command History</b>	<p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> <table><thead><tr><th>Version</th><th>Description</th></tr></thead><tbody><tr><td>9.7(0.0)</td><td>Introduced on the S6000–ON.</td></tr><tr><td>9.0.2.0</td><td>Introduced on the S6000.</td></tr><tr><td>8.3.19.0</td><td>Introduced on the S4820T.</td></tr><tr><td>8.3.11.1</td><td>Introduced on the Z9000.</td></tr><tr><td>8.3.8.0</td><td>Support from 2 to 64 paths on the S4810. Command syntax changed to <code>max-path</code> (was <code>maximum-paths</code> ).	8.3.7.0	Introduced on the S4810.	7.8.1.0	Introduced on the S-Series.	7.7.1.0	Introduced on the C-Series.
Version	Description																		
9.7(0.0)	Introduced on the S6000–ON.																		
9.0.2.0	Introduced on the S6000.																		
8.3.19.0	Introduced on the S4820T.																		
8.3.11.1	Introduced on the Z9000.																		
8.3.8.0	Support from 2 to 64 paths on the S4810. Command syntax changed to <code>max-path</code> (was <code>maximum-paths</code> ).																		
8.3.7.0	Introduced on the S4810.																		
7.8.1.0	Introduced on the S-Series.																		
7.7.1.0	Introduced on the C-Series.																		
<b>Usage Information</b>	If you enable this command, use the <code>clear ip bgp *</code> command to recompute the best path.																		

## neighbor activate

This command allows the specified neighbor/peer group to be enabled for the current AFI/SAFI (Address Family Identifier/Subsequent Address Family Identifier).

### S4820T

<b>Syntax</b>	<code>neighbor [ip-address   peer-group-name] activate</code> To disable, use the <code>no neighbor [ip-address   peer-group-name] activate</code> command.						
<b>Parameters</b>	<table><tr><td><b>ip-address</b></td><td>(OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.</td></tr><tr><td><b>peer-group-name</b></td><td>(OPTIONAL) Enter the name of the peer group.</td></tr><tr><td><b>activate</b></td><td>Enter the keyword <code>activate</code> to enable the neighbor/peer group in the new AFI/SAFI.</td></tr></table>	<b>ip-address</b>	(OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.	<b>peer-group-name</b>	(OPTIONAL) Enter the name of the peer group.	<b>activate</b>	Enter the keyword <code>activate</code> to enable the neighbor/peer group in the new AFI/SAFI.
<b>ip-address</b>	(OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.						
<b>peer-group-name</b>	(OPTIONAL) Enter the name of the peer group.						
<b>activate</b>	Enter the keyword <code>activate</code> to enable the neighbor/peer group in the new AFI/SAFI.						

**Defaults** Disabled

**Command Modes** CONFIGURATION-ROUTER-BGP-ADDRESS FAMILY

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information** By default, when you create a neighbor/peer group configuration in the Router BGP context, this enables IPv4/Unicast AFI/SAFI. When you use `activate` in the new context, the neighbor/peer group enables for AFI/SAFI. It is not possible to de-activate a peer from the IPv4 unicast address family.

## neighbor add-path

This command allows the specified neighbor/peer group to send/receive multiple path advertisements.

### S4820T

<b>Syntax</b>	<code>neighbor [ip-address   peer-group-name] add-path [send   receive   both] path-count</code>												
<b>Parameters</b>	<table><tr><td><b><i>ip-address</i></b></td><td>(OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.</td></tr><tr><td><b><i>peer-group-name</i></b></td><td>(OPTIONAL) Enter the name of the peer group.</td></tr><tr><td><b>send</b></td><td>Enter the keyword <code>send</code> to indicate that the system sends multiple paths to peers.</td></tr><tr><td><b>receive</b></td><td>Enter the keyword <code>receive</code> to indicate that the system accepts multiple paths from peers.</td></tr><tr><td><b>both</b></td><td>Enter the keyword <code>both</code> to indicate that the system sends and accepts multiple paths from peers.</td></tr><tr><td><b><i>path-count</i></b></td><td>Enter the number paths supported. The range is from 2 to 64.</td></tr></table>	<b><i>ip-address</i></b>	(OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.	<b><i>peer-group-name</i></b>	(OPTIONAL) Enter the name of the peer group.	<b>send</b>	Enter the keyword <code>send</code> to indicate that the system sends multiple paths to peers.	<b>receive</b>	Enter the keyword <code>receive</code> to indicate that the system accepts multiple paths from peers.	<b>both</b>	Enter the keyword <code>both</code> to indicate that the system sends and accepts multiple paths from peers.	<b><i>path-count</i></b>	Enter the number paths supported. The range is from 2 to 64.
<b><i>ip-address</i></b>	(OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.												
<b><i>peer-group-name</i></b>	(OPTIONAL) Enter the name of the peer group.												
<b>send</b>	Enter the keyword <code>send</code> to indicate that the system sends multiple paths to peers.												
<b>receive</b>	Enter the keyword <code>receive</code> to indicate that the system accepts multiple paths from peers.												
<b>both</b>	Enter the keyword <code>both</code> to indicate that the system sends and accepts multiple paths from peers.												
<b><i>path-count</i></b>	Enter the number paths supported. The range is from 2 to 64.												
<b>Defaults</b>	none												
<b>Command Modes</b>	CONFIGURATION-ROUTER-BGP-ADDRESS FAMILY												
<b>Command History</b>	<p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> <table><thead><tr><th>Version</th><th>Description</th></tr></thead><tbody><tr><td>9.7(0.0)</td><td>Introduced on the S6000-ON.</td></tr><tr><td>9.0.2.0</td><td>Introduced on the S6000.</td></tr><tr><td>8.3.19.0</td><td>Introduced on the S4820T.</td></tr><tr><td>8.3.11.1</td><td>Introduced on the Z9000.</td></tr><tr><td>8.3.8.0</td><td>Introduced on the S4810.</td></tr></tbody></table>	Version	Description	9.7(0.0)	Introduced on the S6000-ON.	9.0.2.0	Introduced on the S6000.	8.3.19.0	Introduced on the S4820T.	8.3.11.1	Introduced on the Z9000.	8.3.8.0	Introduced on the S4810.
Version	Description												
9.7(0.0)	Introduced on the S6000-ON.												
9.0.2.0	Introduced on the S6000.												
8.3.19.0	Introduced on the S4820T.												
8.3.11.1	Introduced on the Z9000.												
8.3.8.0	Introduced on the S4810.												
<b>Related Commands</b>	<a href="#">bgp add-path</a> — allows the advertisement of multiple paths for the same address prefix without the new paths implicitly replacing any previous ones.												

## neighbor advertisement-interval

Set the advertisement interval between BGP neighbors or within a BGP peer group.

### S4820T

**Syntax** `neighbor {ip-address | peer-group-name} advertisement-interval seconds`

To return to the default value, use the `no neighbor {ip-address | peer-group-name} advertisement-interval` command.

### Parameters

<b>ip-address</b>	(OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.
<b>peer-group-name</b>	Enter the name of the peer group to set the advertisement interval for all routers in the peer group.
<b>seconds</b>	Enter a number as the time interval, in seconds, between BGP advertisements. The range is from 0 to 600 seconds. The default is <b>5 seconds</b> for internal BGP peers and <b>30 seconds</b> for external BGP peers.

### Defaults

- seconds = **5 seconds** (internal peers)
- seconds = **30 seconds** (external peers)

### Command Modes

ROUTER BGP

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

## neighbor advertisement-start

To send BGP routing updates, set the minimum interval before starting.

### S4820T

<b>Syntax</b>	<code>neighbor {ip-address} advertisement-start seconds</code> To return to the default value, use the <code>no neighbor {ip-address} advertisement-start</code> command.				
<b>Parameters</b>	<table><tr><td><b><i>ip-address</i></b></td><td>(OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.</td></tr><tr><td><b><i>seconds</i></b></td><td>Enter a number as the time interval, in seconds, before BGP route updates are sent. The range is from 0 to 3600 seconds.</td></tr></table>	<b><i>ip-address</i></b>	(OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.	<b><i>seconds</i></b>	Enter a number as the time interval, in seconds, before BGP route updates are sent. The range is from 0 to 3600 seconds.
<b><i>ip-address</i></b>	(OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.				
<b><i>seconds</i></b>	Enter a number as the time interval, in seconds, before BGP route updates are sent. The range is from 0 to 3600 seconds.				
<b>Defaults</b>	none				
<b>Command Modes</b>	ROUTER BGP				
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .				

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

## neighbor allowas-in

Set the number of times an AS number can occur in the AS path.

### S4820T

<b>Syntax</b>	<code>neighbor {ip-address   peer-group-name} allowas-in number</code> To return to the default value, use the <code>no neighbor {ip-address   peer-group-name} allowas-in</code> command.
---------------	---

<b>Parameters</b>	<i>ip-address</i>	(OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.
	<i>peer-group-name</i>	Enter the name of the peer group to set the advertisement interval for all routers in the peer group.
	<i>number</i>	Enter a number of times to allow this neighbor ID to use the AS path. The range is from 1 to 10.

**Defaults** Not configured.

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information** You cannot set this configuration for a peer that is associated with a peer group. Similarly, you cannot associate a peer to a peer group if that peer is already configured with these settings.

**Related Commands** [bgp four-octet-as-support](#) — enables 4-byte support for the BGP process.

## neighbor default-originate

Inject the default route to a BGP peer or neighbor.

### S4820T

**Syntax**

```
neighbor {ip-address | peer-group-name} default-originate
[route-map map-name]
```

To remove a default route, use the `no neighbor {ip-address | peer-group-name} default-originate` command.

<b>Parameters</b>	<b><i>ip-address</i></b>	(OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.
	<b><i>peer-group-name</i></b>	Enter the name of the peer group to set the default route of all routers in that peer group.
	<b><i>route-map map-name</i></b>	(OPTIONAL) Enter the keyword <code>route-map</code> then the name of a configured route map.

**Defaults** Not configured.

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

<b>Version</b>	<b>Description</b>
<b>9.7(0.0)</b>	Introduced on the S6000–ON.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.8.1.0</b>	Introduced on the S-Series.
<b>7.7.1.0</b>	Introduced on the C-Series.

**Usage Information** If you apply a route map to a BGP peer or neighbor with the `neighbor default-originate` command configured, the software does not apply the set filters in the route map to that BGP peer or neighbor.

When you configure a route-map for a BGP peer or peer group with the `neighbor default-originate` command, the command checks for the existence of the route in BGP RIB.

Route-map configuration on a BGP peer or peer group works only when the LOC-RIB contains at least one route.

When you apply a default route to a BGP peer or peer group using the `neighbor default-originate` command, changes to the configured default route-map are applied to the BGP peer or peer group only after a delay of 15 seconds. As a result, you must wait for a period of 15 seconds before manually resetting BGP using the `clear ip bgp` command.

In case of eBGP, the `neighbor default-originate` command does not support *extended-community* as a non-transitive route-map attribute.

You cannot set this configuration for a peer that is associated with a peer group. Similarly, you cannot associate a peer to a peer group if that peer is already configured with these settings.

In order that settings corresponding to the `neighbor default-originate` command take effect, you must execute the `clear ip bgp` command immediately after you execute the `neighbor default-originate` command.

## neighbor description

Assign a character string describing the neighbor or group of neighbors (peer group).

### S4820T

**Syntax** `neighbor {ip-address | peer-group-name} description text`  
To delete a description, use the `no neighbor {ip-address | peer-group-name} description` command.

<b>Parameters</b>	<b><i>ip-address</i></b>	Enter the IP address of the neighbor in dotted decimal format.
	<b><i>peer-group-name</i></b>	Enter the name of the peer group.
	<b><i>text</i></b>	Enter a continuous text string up to 80 characters.

**Defaults** Not configured.

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

## neighbor distribute-list

Distribute BGP information via an established prefix list.

### S4820T

**Syntax** `neighbor {ip-address | peer-group-name} distribute-list prefix-list-name {in | out}`

To delete a neighbor distribution list, use the `no neighbor {ip-address | peer-group-name} distribute-list prefix-list-name {in | out}` command.

### Parameters

<b>ip-address</b>	Enter the IP address of the neighbor in dotted decimal format.
<b>peer-group-name</b>	Enter the name of the peer group to apply the distribute list filter to all routers in the peer group.
<b>prefix-list-name</b>	Enter the name of an established prefix list.  If the prefix list is not configured, the default is <b>permit</b> (to allow all routes).
<b>in</b>	Enter the keyword <code>in</code> to distribute only inbound traffic.
<b>out</b>	Enter the keyword <code>out</code> to distribute only outbound traffic.

**Defaults** Not configured.

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

<b>Usage Information</b>	Other BGP filtering commands include: <code>neighbor filter-list</code> , <code>ip as-path access-list</code> , and <code>neighbor route-map</code> .
<b>Related Commands</b>	<a href="#">neighbor route-map</a> — assigns a route map to a neighbor or peer group.

## neighbor ebgp-multihop

Attempt and accept BGP connections to external peers on networks that are not directly connected.

### S4820T

**Syntax** `neighbor {ip-address | peer-group-name} ebgp-multihop [ttl]`  
 To disallow and disconnect connections, use the `no neighbor {ip-address | peer-group-name} ebgp-multihop` command.

<b>Parameters</b>	<b><i>ip-address</i></b>	Enter the IP address of the neighbor in dotted decimal format.
	<b><i>peer-group-name</i></b>	Enter the name of the peer group.
	<b>ttl</b>	(OPTIONAL) Enter the number of hops as the Time to Live (ttl) value. The range is from 1 to 255. The default is <b>255</b> .

**Defaults** Disabled.

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information** To prevent loops, the `neighbor ebgp-multihop` command does not install the default routes of the multihop peer. Networks not directly connected are not considered valid for best-path selection.

## neighbor fall-over

Enable or disable fast fall-over for BGP neighbors.

### S4820T

**Syntax** `neighbor {ipv4-address | peer-group-name} fall-over`  
To disable, use the `no neighbor {ipv4-address | peer-group-name} fall-over` command.

**Parameters**

<i>ipv4-address</i>	Enter the IP address of the neighbor in dotted decimal format.
<i>peer-group-name</i>	Enter the name of the peer group.

**Defaults** Disabled.

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.4.1.0	Introduced

**Usage Information** When you enable failover, BGP keeps track of IP or IPv6 ability to reach the peer remote address and the peer local address. Whenever either address becomes unreachable (for example, no active route exists in the routing table for the peer IP or IPv6 destination/local address), BGP brings down the session with the peer.

Related  
Commands

[show ip bgp neighbors](#) — displays information on the BGP neighbors.

## neighbor local-as

To accept external routes from neighbors with a local AS number in the AS number path, configure Internal BGP (IBGP) routers.

### S4820T

**Syntax** `neighbor {ip-address | peer-group-name} local-as as-number [no-prepend]`

To return to the default value, use the `no neighbor {ip-address | peer-group-name} local-as` command.

### Parameters

<b><i>ip-address</i></b>	Enter the IP address of the neighbor in dotted decimal format.
<b><i>peer-group-name</i></b>	Enter the name of the peer group to set the advertisement interval for all routers in the peer group.
<b><i>as-number</i></b>	Enter the AS number to reset all neighbors belonging to that AS. The range is from 0 to 65535 (2 byte), from 1 to 4294967295 (4 byte) or from 0.1 to 65535.65535 (dotted format).
<b>no prepend</b>	Specifies that local AS values do not prepend to announcements from the neighbor.

**Defaults** Not configured.

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information**

If a local-as is configured, BGP does not allow for the configuration of BGP confederation. Similarly, if BGP confederation is configured, then BGP does not allow the configuration of local-as.

This command automatically restarts the neighbor session for the configuration to take effect.

**Related Commands**

[bgp four-octet-as-support](#) — enables 4-byte support for the BGP process.

## neighbor maximum-prefix

Control the number of network prefixes received.

### S4820T

**Syntax**

```
neighbor {ip-address | peer-group-name} maximum-prefix maximum [threshold] [warning-only]
```

To return to the default values, use the `no neighbor {ip-address | peer-group-name} maximum-prefix maximum` command.

**Parameters**

- ip-address** Enter the IP address of the neighbor in dotted decimal format.
- peer-group-name** Enter the name of the peer group.
- maximum** Enter a number as the maximum number of prefixes allowed for this BGP router. The range is from 1 to 4294967295.
- threshold** (OPTIONAL) Enter a number to be used as a percentage of the maximum value. When the number of prefixes reaches this percentage of the maximum value, the E-Series software sends a message. The range is from 1 to 100 percent. The default is **75**.
- warning-only** (OPTIONAL) Enter the keyword `warning-only` to set the router to send a log message when the maximum value is reached. If this parameter is not set, the router stops peering when the maximum number of prefixes is reached.

**NOTE:** When you set this option, the router accepts BGP prefixes only until the maximum configured value. After the maximum number is reached, the router drops any additional prefixes that it receives.

**Defaults**

threshold = **75**

**Command Modes**

ROUTER BGP

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

## Usage Information

If you configure the `neighbor maximum-prefix` command and the neighbor receives more prefixes than the `neighbor maximum-prefix` command configuration allows, the neighbor goes down and the `show ip bgp summary` command displays (prfxd) in the State/PfxRcd column for that neighbor. The neighbor remains down until you enter the `clear ip bgp` command for the neighbor or the peer group to which the neighbor belongs or you enter the `neighbor shutdown` and `neighbor no shutdown` commands.

## Related Commands

[show ip bgp summary](#) — displays the current BGP configuration.

## neighbor password

Enable message digest 5 (MD5) authentication on the TCP connection between two neighbors.

### S4820T

#### Syntax

```
neighbor {ip-address | peer-group-name} password [encryption-type] password
```

To delete a password, use the `no neighbor {ip-address | peer-group-name} password` command.

#### Parameters

<b><i>ip-address</i></b>	Enter the IP address of the router to be included in the peer group.
<b><i>peer-group-name</i></b>	Enter the name of a configured peer group.
<b><i>encryption-type</i></b>	(OPTIONAL) Enter 7 as the encryption type for the password entered. 7 means that the password is encrypted and hidden.

**password** Enter a text string up to 80 characters long. The first character of the password must be a letter.

You cannot use spaces in the password.

**Defaults** Not configured.

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information**

This command automatically restarts the neighbor session for the configuration to take effect.

Configure the same password on both BGP peers or a connection does not occur. When you configure MD5 authentication between two BGP peers, each segment of the TCP connection between them is verified and the MD5 digest is checked on every segment sent on the TCP connection.

Configuring a password for a neighbor causes an existing session to be torn down and a new one established.

If you specify a BGP peer group by using the `peer-group-name` parameter, all the members of the peer group inherit the characteristic configured with this command.

If you configure a password on one neighbor, but you have not configured a password for the neighboring router, the following message appears on the console while the routers attempt to establish a BGP session between them:

```
%RPM0-P:RP1 %KERN-6-INT: No BGP MD5 from [peer's IP address]  
:179 to [local router's IP address]:65524
```

Also, if you configure different passwords on the two routers, the following message appears on the console:

```
%RPM0-P:RP1 %KERN-6-INT: BGP MD5 password mismatch from  
[peer's IP address] : 11502 to [local router's IP address] :179
```

## neighbor peer-group (assigning peers)

Allows you to assign one peer to an existing peer group.

### S4820T

#### Syntax

```
neighbor {ip-address | peer-group peer-group-name} dmzlink-bw
```

To delete a peer from a peer group, use the `no neighbor {ip-address | peer-group peer-group-name}` command.

To disable `dmzlink-dw` for the peer group, use the `no neighbor ip-address dmzlink-dw` command.

#### Parameters

**ip-address** Enter the IP address of the router to be included in the peer group.

**peer-group-name** Enter the name of a configured peer group.

**dmzlink-bw** Enter the keyword `dmzlink-bw` to attach a link bandwidth to received routes.

**NOTE:** If `dmzlink-bw` is configured for a peer, in order for the BGP peer to advertise the prefixes with `dmzlink-bw` attached to it, you must reset the the peer or peer-group using the `clear ip bgp session` command.

**Defaults** Not configured.

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Added the <code>dmzlink-bw</code> parameter.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.

Version	Description
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

## Usage Information

You can assign up to 256 peers to one peer group.

When you add a peer to a peer group, it inherits all the peer group's configured parameters. A peer cannot become part of a peer group if any of the following commands are configured on the peer:

- [neighbor advertisement-interval](#)
- [neighbor distribute-list](#)
- [neighbor route-map](#)
- [neighbor route-reflector-client](#)

if a neighbor's configuration is more specific than its peer group's configuration, the neighbor may retain its configuration after it is added to the peer group. The neighbor's configuration does not affect outgoing updates.

A peer group must exist (be enabled) before you add a peer to it. If the peer group is disabled (shutdown), the peers within that group are also disabled (shutdown).

In BGP, you cannot associate a peer to a peer-group without configuring the remote-as for Internal BGP (IBGP) or External BGP (EBGP).

This command automatically restarts the neighbor session for the configuration to take effect.

## Related Commands

[clear ip bgp](#) — resets BGP sessions.

[neighbor peer-group \(creating group\)](#) — creates a peer group.

[show ip bgp peer-group](#) — views BGP peers.

[show ip bgp neighbors](#) — views BGP neighbors configurations.

## neighbor peer-group (creating group)

Allows you to create a peer group and assign it a name.

### S4820T

#### Syntax

```
neighbor peer-group-name peer-group
```

To delete a peer group, use the `no neighbor peer-group-name peer-group` command.

<b>Parameters</b>	<i>peer-group-name</i>	Enter a text string up to 16 characters long as the name of the peer group.
<b>Defaults</b>	Not configured.	
<b>Command Modes</b>	ROUTER BGP	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .	

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information** When you create a peer group, it is disabled (Shut mode).

**Related Commands**

- [neighbor peer-group \(assigning peers\)](#) — assigns routers to a peer group.
- [neighbor remote-as](#) — assigns a indirectly connected AS to a neighbor or peer group.
- [neighbor shutdown](#) — disables a peer or peer group.

## neighbor peer-group passive

Enable passive peering on a BGP peer group, that is, the peer group does not send an OPEN message, but responds to one.

### S4820T

**Syntax**

```
neighbor peer-group-name peer-group passive [limit sessions]
```

To delete a passive peer-group, use the `no neighbor peer-group-name peer-group passive` command.

## Parameters

<b><i>peer-group-name</i></b>	Enter a text string up to 16 characters long as the name of the peer group.
<b>limit</b>	(Optional) Enter the keyword <code>limit</code> to constrain the numbers of sessions for this peer-group. The range is from 2 to 256. The default is <b>256</b> .

## Defaults

Not configured.

## Command Modes

ROUTER BGP

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.8.0	Introduced the <code>limit</code> keyword on the S4810.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

## Usage Information

After you configure a peer group as passive, assign it a subnet using the `neighbor soft-reconfiguration inbound` command.

For passive eBGP limits, the Remote AS must be different from the AS for this neighbor.

## Related Commands

[neighbor soft-reconfiguration inbound](#) — assigns a subnet to a dynamically configured BGP neighbor.

[neighbor remote-as](#) — assigns an indirectly connected AS to a neighbor or peer group.

## neighbor remote-as

Create and specify the remote peer to the BGP neighbor.

### S4820T

**Syntax** `neighbor {ip-address | peer-group-name} remote-as number`  
To delete a remote AS entry, use the `no neighbor {ip-address | peer-group-name} remote-as number` command.

**Parameters**

<b><i>ip-address</i></b>	Enter the IP address of the neighbor to enter the remote AS in its routing table.
<b><i>peer-group-name</i></b>	Enter the name of the peer group to enter the remote AS into routing tables of all routers within the peer group.
<b><i>number</i></b>	Enter a number of the AS. The range is from 0 to 65535 (2 byte) or from 1 to 4294967295 (4 byte).

**Defaults** Not configured.

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series. Added 4-byte support.

**Usage Information** To accept 4-byte formats before entering a 4 byte AS Number, configure your system. If the `number` parameter is the same as the AS number used in the `router bgp` command, the remote AS entry in the neighbor is considered an internal BGP peer entry.

This command creates a peer and the newly created peer is disabled (Shutdown).

This command automatically restarts the neighbor session for the configuration to take effect.

**Related  
Commands**

[router bgp](#) — enters ROUTER BGP mode and configures routes in an AS.  
[bgp four-octet-as-support](#) — enables 4-byte support for the BGP process.

## neighbor remove-private-as

Remove private AS numbers from the AS-PATH of outgoing updates.

### S4820T

**Syntax**

```
neighbor {ip-address | peer-group-name} remove-private-as
```

To return to the default, use the `no neighbor {ip-address | peer-group-name} remove-private-as` command.

**Parameters**

<b><i>ip-address</i></b>	Enter the IP address of the neighbor to remove the private AS numbers.
<b><i>peer-group-name</i></b>	Enter the name of the peer group to remove the private AS numbers.

**Defaults**

Disabled (that is, private AS number are not removed).

**Command  
Modes**

ROUTER BGP

**Command  
History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series. Added 4-byte support.

**Usage  
Information**

Applies to EBGP neighbors only.

Configure your system to accept 4-byte formats before entering a 4 byte AS Number.

If the AS-PATH contains both public and private AS number or contains AS numbers of an EBGp neighbor, the private AS numbers are not removed.

If a confederation contains private AS numbers in its AS-PATH, the software removes the private AS numbers only if they follow the confederation numbers in the AS path.

Private AS numbers are from 64512 to 65535 (2 byte).

## neighbor route-map

Apply an established route map to either incoming or outbound routes of a BGP neighbor or peer group.

### S4820T

**Syntax** `neighbor {ip-address | peer-group-name} route-map map-name {in | out}`

To remove the route map, use the `no neighbor {ip-address | peer-group-name} route-map map-name {in | out}` command.

#### Parameters

**ip-address** Enter the IP address of the neighbor in dotted decimal format.

**peer-group-name** Enter the name of the peer group.

**map-name** Enter the name of an established route map.

If the Route map is not configured, the default is **deny** (to drop all routes).

**in** Enter the keyword `in` to filter inbound routes.

**out** Enter the keyword `out` to filter outbound routes.

**NOTE:** This command sends routes to peers only if an outbound policy is configured and if there is a change in the existing outbound policy.

**Defaults** Not configured.

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

#### Usage Information

When you apply a route map to outbound routes, only routes that match at least one section of the route map are permitted.

If you identify a peer group by name, the peers in that peer group inherit the characteristics in the Route map used in this command. If you identify a peer by IP address, the Route map overwrites either the inbound or outbound policies on that peer.

## neighbor route-reflector-client

Configure the router as a route reflector and the specified neighbors as members of the cluster.

### S4820T

#### Syntax

```
neighbor {ip-address | peer-group-name} route-reflector-client
```

To remove one or more neighbors from a cluster, use the `no neighbor {ip-address | peer-group-name} route-reflector-client` command. If you delete all members of a cluster, you also delete the route-reflector configuration on the router.

#### Parameters

<i>ip-address</i>	Enter the IP address of the neighbor in dotted decimal format.
<i>peer-group-name</i>	Enter the name of the peer group. All routers in the peer group receive routes from a route reflector.

#### Defaults

Not configured.

#### Command Modes

ROUTER BGP

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

#### Usage Information

A route reflector reflects routes to the neighbors assigned to the cluster. Neighbors in the cluster do not need not to be fully meshed. By default, when you use `no route reflector`, the internal BGP (IBGP) speakers in the network must be fully meshed.

The first time you enter this command, the router configures as a route reflector and the specified BGP neighbors configure as clients in the route-reflector cluster.

When you remove all clients of a route reflector using the `no neighbor route-reflector-client` command, the router no longer functions as a route reflector.

If the clients of a route reflector are fully meshed, you can configure the route reflector to not reflect routes to specified clients by using the `no bgp client-to-client reflection` command.

This command automatically restarts the neighbor session for the configuration to take effect.

#### Related Commands

[bgp client-to-client reflection](#) — enables route reflection between the route reflector and the clients.

## neighbor send-community

Send a COMMUNITY attribute to a BGP neighbor or peer group. A COMMUNITY attribute indicates that all routes with that attribute belong to the same community grouping.

### S4820T

#### Syntax

```
neighbor {ip-address | peer-group-name} send-community  
[extended | standard]
```

To disable sending a COMMUNITY attribute, use the `no neighbor {ip-address | peer-group-name} send-community` command.

<b>Parameters</b>	<i>ip-address</i>	Enter the IP address of the peer router in dotted decimal format.
	<i>peer-group-name</i>	Enter the name of the peer group to send a COMMUNITY attribute to all routers within the peer group.
	<b>extended</b>	(OPTIONAL) Enter the keyword <code>extended</code> to send extended community attribute.
	<b>standard</b>	(OPTIONAL) Enter the keyword <code>standard</code> to send standard community attribute.

**Defaults** Not configured and COMMUNITY attributes are not sent to neighbors.

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

<b>Version 9.0.2.0</b>	Introduced on the S6000.
<b>Version</b>	<b>Description</b>
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>7.8.1.0</b>	Introduced on the S-Series.
<b>7.7.1.0</b>	Introduced on the C-Series.

**Usage Information** To configure a COMMUNITY attribute, use the `set community` command in ROUTE-MAP mode.

In order that settings corresponding to the `neighbor send-community` command take effect, you must execute the `clear ip bgp` command immediately after you execute the `neighbor send-community` command.

If you do not set any of the optional parameters (`standard` or `extended`), then both `standard` as well as `extended` attributes are sent. If you set either the `standard` or `extended` parameter, only the attribute that is specified is sent.

## neighbor shutdown

Disable a BGP neighbor or peer group.

### S4820T

**Syntax** `neighbor {ip-address | peer-group-name} shutdown`

To enable a disabled neighbor or peer group, use the `neighbor {ip-address | peer-group-name}no shutdown` command.

#### Parameters

<b><i>ip-address</i></b>	Enter the IP address of the neighbor in dotted decimal format.
<b><i>peer-group-name</i></b>	Enter the name of the peer group to disable or enable all routers within the peer group.

#### Defaults

Enabled (that is, BGP neighbors and peer groups are disabled.)

#### Command Modes

ROUTER BGP

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

#### Usage Information

Peers that are enabled within a peer group are disabled when their peer group is disabled.

The `neighbor shutdown` command terminates all BGP sessions on the BGP neighbor or BGP peer group. Use this command with caution as it terminates the specified BGP sessions. When a neighbor or peer group is shut down, use the `show ip bgp summary` command to confirm its status.

#### Related Commands

[show ip bgp summary](#) — displays the current BGP configuration.

[show ip bgp neighbors](#) — displays the current BGP neighbors.

## neighbor soft-reconfiguration inbound

Enable soft-reconfiguration for BGP.

### S4820T

**Syntax** `neighbor {ip-address | peer-group-name} soft-reconfiguration inbound`  
To disable, use the `no neighbor {ip-address | peer-group-name} soft-reconfiguration inbound` command.

**Parameters**

<b><i>ip-address</i></b>	Enter the IP address of the neighbor in dotted decimal format.
<b><i>peer-group-name</i></b>	Enter the name of the peer group to disable or enable all routers within the peer group.

**Defaults** Disabled

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.4.1.0	Introduced.

**Usage Information** This command enables soft-reconfiguration for the BGP neighbor specified. BGP stores all the updates the neighbor receives but does not reset the peer-session.

You cannot set this configuration for a peer that is associated with a peer group. Similarly, you cannot associate a peer to a peer group if that peer is already configured with these settings.

**CAUTION:** Inbound update storage is a memory-intensive operation. The entire BGP update database from the neighbor is stored in memory regardless of the inbound policy results applied on the neighbor.

**NOTE:** This command is supported in BGP Router Configuration mode for IPv4 Unicast address only.

**Related  
Commands**

[show ip bgp neighbors](#) — displays routes received by a neighbor.

## neighbor timers

Set keepalive and hold time timers for a BGP neighbor or a peer group.

### S4820T

**Syntax**

```
neighbor {ip-address | peer-group-name} timers keepalive holdtime
```

To return to the default values, use the `no neighbor {ip-address | peer-group-name} timers` command.

**Parameters**

<i>ip-address</i>	Enter the IP address of the peer router in dotted decimal format.
<i>peer-group-name</i>	Enter the name of the peer group to set the timers for all routers within the peer group.
<i>keepalive</i>	Enter a number for the time interval, in seconds, between keepalive messages sent to the neighbor routers. The range is from 1 to 65535. The default is <b>60 seconds</b> .
<i>holdtime</i>	Enter a number for the time interval, in seconds, between the last keepalive message and declaring the router dead. The range is from 3 to 65535. The default is <b>180 seconds</b> .

**Defaults**

- keepalive = **60 seconds**
- holdtime = **180 seconds**

**Command  
Modes**

ROUTER BGP

**Command  
History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

#### Usage Information

Timer values configured with the `neighbor timers` command override the timer values configured with any other command.

When two neighbors, configured with different `keepalive` and `holdtime` values, negotiate for new values, the resulting values are as follows:

- the lower of the `holdtime` value is the new `holdtime` value, and
- whichever is the lower value; one-third of the new `holdtime` value, or the configured `keepalive` value, is the new `keepalive` value.

## neighbor update-source

Enable the E-Series software to use Loopback interfaces for TCP connections for BGP sessions.

### S4820T

#### Syntax

```
neighbor {ip-address | peer-group-name} update-source interface
```

To use the closest interface, use the `no neighbor {ip-address | peer-group-name} update-source interface` command.

#### Parameters

<b><i>ip-address</i></b>	Enter the IP address of the peer router in dotted decimal format.
<b><i>peer-group-name</i></b>	Enter the name of the peer group to disable all routers within the peer group.
<b><i>interface</i></b>	Enter the keyword <code>loopback</code> then a number of the Loopback interface. The range is from 0 to 16383.

#### Defaults

Not configured.

#### Command Modes

ROUTER BGP

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

#### Usage Information

Loopback interfaces are up constantly and the BGP session may need one interface constantly up to stabilize the session. The `neighbor update-source` command is not necessary for directly connected internal BGP sessions.

Neighbors are sorted according to the source and destination ip addresses. If an update-source ip address exists, then the source ip address determines the order in which the neighbors are displayed.

## neighbor weight

Assign a weight to the neighbor connection, which is used to determine the best path.

### S4820T

#### Syntax

```
neighbor {ip-address | peer-group-name} weight weight
```

To remove a weight value, use the `no neighbor {ip-address | peer-group-name} weight` command.

#### Parameters

<b><i>ip-address</i></b>	Enter the IP address of the peer router in dotted decimal format.
<b><i>peer-group-name</i></b>	Enter the name of the peer group to disable all routers within the peer group.
<b><i>weight</i></b>	Enter a number as the weight. The range is from 0 to 65535. The default is <b>0</b> .

**Defaults** 0

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

### Usage Information

In the Dell Networking OS best path selection process, the path with the highest weight value is preferred.

**NOTE:** In the Dell Networking OS best-path selection process, the path with the highest weight value is preferred.

If you configure the `set weight` command in a route map applied to this neighbor, the weight set in that command overrides the weight set in the `neighbor weight` command.

### Related Commands

[set weight](#) — assigns a weight to all paths meeting the route map criteria.

## network

Specify the networks for the BGP process and enter them in the BGP routing table.

### S4820T

#### Syntax

```
network ip-address mask [route-map map-name]
```

To remove a network, use the `no network ip-address mask [route-map map-name]` command.

#### Parameters

**ip-address** Enter an IP address in dotted decimal format of the network.

**mask** Enter the mask of the IP address in the slash prefix length format (for example, /24).

The mask appears in command outputs in dotted decimal format (A.B.C.D).

**route-map map-name** (OPTIONAL) Enter the keyword `route-map` then the name of an established route map.

Only the following ROUTE-MAP mode commands are supported:

- [match ip address](#)
- [set community](#)
- [set local-preference](#)
- [set metric](#)
- [set next-hop](#)
- [set origin](#)
- [set weight](#)

If the route map is not configured, the default is **deny** (to drop all routes).

**Defaults** Not configured.

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information** Dell Networking OS software resolves the network address the `network` command configures with the routes in the main routing table to ensure that the networks are reachable using non-BGP routes and non-default routes.

As BGP does not query next-hop information corresponding to locally originated routes, a local route with an unreachable next-hop is chosen as the best route.

When a combination of locally originated and peer originated routes occurs, both these routes will exist in the RTM. However, only the best route is kept active in the RTM and the remaining route is rendered in-active.

It is possible to keep only one locally originated route in the BGP database. Network command has preference over the re-distributed routes. When the locally originated route is no longer present in the database the other route is automatically installed.

In BGP, the next-hop for the route is calculated from the information that is acquired through IGP or static routes.

**Related Commands**      [redistribute](#) — redistributes routes into BGP.

## network backdoor

Specify this IGP route as the preferred route.

### S4820T

**Syntax**      `network ip-address mask backdoor`  
To remove a network, use the `no network ip-address mask backdoor` command.

**Parameters**

<i>ip-address</i>	Enter an IP address in dotted decimal format of the network.
<i>mask</i>	Enter the mask of the IP address in the slash prefix length format (for example, /24).  The mask appears in command outputs in dotted decimal format (A.B.C.D).

**Defaults**      Not configured.

**Command Modes**      ROUTER BGP

**Command History**      This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information** Although Dell Networking OS does not generate a route due to the backdoor config, there is an option for injecting/sourcing a local route in the presence of network backdoor config on a learned route.

## permit bandwidth

Enables you to specify link band width extended-community attribute as the matching criteria to permit incoming or outgoing traffic.

**Syntax** `permit bandwidth`  
To disable this setting, enter the `no permit bandwidth` command.

**Parameters**

<b>bandwidth</b>	Enter the keyword <code>bandwidth</code> to specify extended-community attribute as the matching criteria for permitting traffic. The range is from 0 to 102400.
------------------	--

**Defaults** N/A

**Command Modes** EXTENDED COMMUNITY LIST

**Command History**

Version	Description
9.7(0.0)	Introduced on the S-Series.

**Related Commands** [deny bandwidth](#) – link band width extended-community attribute as the matching criteria to deny incoming or outgoing traffic..

## redistribute

Redistribute routes into BGP.

### S4820T

**Syntax** `redistribute {connected | static} [route-map map-name]`  
To disable redistribution, use the `no redistribution {connected | static}` command.

**Parameters**

<b>connected</b>	Enter the keyword <code>connected</code> to redistribute routes from physically connected interfaces.
<b>static</b>	Enter the keyword <code>static</code> to redistribute manually configured routes.  These routes are treated as incomplete routes.

**route-map**  
**map-name**

(OPTIONAL) Enter the keyword `route-map` then the name of an established route map.

Only the following ROUTE-MAP mode commands are supported:

- [match ip address](#)
- [set community](#)
- [set local-preference](#)
- [set metric](#)
- [set next-hop](#)
- [set origin](#)
- [set weight](#)

If the route map is not configured, the default is **deny** (to drop all routes).

**Defaults**

Not configured.

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced the ability to substitute IGP cost for MED when a peer/peer-group outbound route-map is set as <b>internal</b> .
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information**

You can use the `redistribute` command to advertise the IGP cost as the MED on redistributed routes. When you set the route-map with metric-type internal and applied outbound to an EBGp peer/peer-group, the advertised routes corresponding to those peer/peer-groups have the IGP cost set as **MED**.

If you do not configure the `default-metric` command, in addition to the `redistribute` command, or there is no route map to set the metric, the metric for redistributed static and connected is "0".

To redistribute the default route (0.0.0.0/0), configure the `neighbor default-originate` command.

As BGP does not query next-hop information corresponding to locally originated routes, a local route with an unreachable next-hop is chosen as the best route.

When a combination of locally originated and peer originated routes occurs, both these routes will exist in the RTM. However, only the best route is kept active in the RTM and the remaining route is rendered in-active.

It is possible to keep only one locally originated route in the BGP database. Network command has preference over the re-distributed routes. When the locally originated route is no longer present in the database the other route is automatically installed.

**Related Commands**      [neighbor default-originate](#) — injects the default route.

## redistribute ospf

Redistribute OSPF routes into BGP.

### S4820T

**Syntax**      `redistribute ospf process-id [[match external {1 | 2}] [match internal]] [route-map map-name]`

To stop redistribution of OSPF routes, use the `no redistribute ospf process-id` command.

### Parameters

<b><i>process-id</i></b>	Enter the number of the OSPF process. The range is from 1 to 65535.
<b><i>match external {1   2}</i></b>	(OPTIONAL) Enter the keywords <code>match external</code> to redistribute OSPF external routes. You can specify 1 or 2 to redistribute those routes only.
<b><i>match internal</i></b>	(OPTIONAL) Enter the keywords <code>match internal</code> to redistribute OSPF internal routes only.
<b><i>route-map map-name</i></b>	(OPTIONAL) Enter the keywords <code>route-map</code> then the name of a configured route map.

**Defaults**      Not configured.

**Command Modes**      ROUTER BGP

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced the ability to substitute IGP cost for MED when a peer/peer-group outbound route-map is set as <b>internal</b> .
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

## Usage Information

You can use the `redistribute` command to advertise the IGP cost as the MED on redistributed routes. When you set the route-map with metric-type internal and apply outbound to an EBGp peer/peer-group, the advertised routes corresponding to those peer/peer-groups have the IGP cost set as **MED**.

When you enter the `redistribute isis process-id` command without any other parameters, Dell Networking OS redistributes all OSPF internal routes, external type 1 routes, and external type 2 routes. RFC does not support this feature.

## router bgp

To configure and enable BGP, enter ROUTER BGP mode.

### S4820T

#### Syntax

```
router bgp as-number
```

To disable BGP, use the `no router bgp as-number` command.

#### Parameters

**as-number** Enter the AS number. The range is from 1 to 65535 (2 byte), from 1 to 4294967295 (4 byte), or from 0.1 to 65535.65535 (dotted format).

#### Defaults

Not enabled.

#### Command Modes

CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

## Usage Information

At least one interface must be in Layer 3 mode for the `router bgp` command to be accepted. If no interfaces are enabled for Layer 3, an error message appears:

```
% Error: No router id configured
```

BGP does not allow 23456 (AS-TRANS) as a configured AS number.

## Example

```
Dell(conf)#router bgp 3  
Dell(conf-router_bgp)#
```

## set extcommunity bandwidth

Enables you to set extended community bandwidth.

### Syntax

```
set extcommunity bandwidth
```

To disable extended community bandwidth, enter the `no set extcommunity bandwidth` command.

### Parameters

<b>bandwidth</b>	Enter the keyword <code>bandwidth</code> to enable extended community bandwidth. The range is from 0 to 102400.
------------------	---

### Defaults

N/A

### Command Modes

ROUTER MAP

### Command History

Version	Description
9.7(0.0)	Introduced on the S-Series.

## Usage Information

A new policy command is introduced in order to attach the Link Bandwidth extended community only to the prefixes that are received from a neighbor that satisfy the desired conditions. This command is relevant for both inbound as well as outbound policy handling (for received prefixes). Also, there is no change to the set of supported conditions or filters.

During configuration, the bandwidth is specified in Mbps, not in bytes/second. While creating the actual LB extended community, the system will attach the AS number and encode the bandwidth in floating point format.

## show capture bgp-pdu neighbor

Display BGP packet capture information for an IPv4 address on the system.

### S4820T

<b>Syntax</b>	<code>show capture bgp-pdu neighbor ipv4-address</code>	
<b>Parameters</b>	<b><i>ipv4-address</i></b>	Enter the IPv4 address (in dotted decimal format) of the BGP address to display packet information for that address.
<b>Command Modes</b>	EXEC Privilege	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .	

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.5.1.0	Introduced.

### Example

```
Dell(conf-router_bgp)#show capture bgp-pdu neighbor 20.20.20.2
Incoming packet capture enabled for BGP neighbor 20.20.20.2
Available buffer size 40958758, 26 packet(s) captured using
680 bytes
  PDU[1] : len 101, captured 00:34:51 ago
          ffffffff ffffffff ffffffff ffffffff 00650100 00000013
00000000
```

```

  ffffffff ffffffff ffffffff ffffffff 00130400
  PDU[3] : len 19, captured 00:34:50 ago
  ffffffff ffffffff ffffffff ffffffff 00130400
[. . .]
Dell#

```

## show config

View the current ROUTER BGP configuration.

### S4820T

<b>Syntax</b>	show config
<b>Command Modes</b>	ROUTER BGP
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

## Example

```
Dell(conf-router_bgp)#show config
!
router bgp 100
 network 1.1.11.1/32
 network 1.1.12.1/32
 network 1.1.13.1/32
 neighbor 10.1.1.2 remote-as 200
 neighbor 10.1.1.2 no shutdown
```

## show ip bgp

View the current BGP IPv4 routing table for the system.

### S4820T

#### Syntax

```
show ip bgp [vrf vrf-name] [ipv4 unicast] [network [network-mask] [longer-prefixes]]
```

#### Parameters

<b>vrf <i>vrf-name</i></b>	(OPTIONAL) Enter the keyword <code>vrf</code> and then the name of the VRF to view <code>ipv4-unicast</code> route information corresponding to that VRF.
<b><i>ipv4 unicast</i></b>	(OPTIONAL) Enter the keywords <code>ipv4 unicast</code> to view information only related to <code>ipv4 unicast</code> routes.
<b><i>network</i></b>	(OPTIONAL) Enter the network address (in dotted decimal format) of the BGP network to view information only on that network.
<b><i>network-mask</i></b>	(OPTIONAL) Enter the network mask (in slash prefix format) of the BGP network address.
<b><i>longer-prefixes</i></b>	(OPTIONAL) Enter the keywords <code>longer-prefixes</code> to view all routes with a common prefix.

#### Command Modes

- EXEC
- EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.4.(0.0)	Added support for VRF.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.

Version	Description
8.3.11.1	Introduced on the Z9000.
8.3.8.0	Added the <code>add-path</code> option to the S4810. Output on the S4810 shows the ADDPATH parameters.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

### Usage Information

When you enable the `bgp non-deterministic-med` command, the `show ip bgp` command output for a BGP route does not list the INACTIVE reason. In BGP, this command displays the exact reason why the route is discarded.

The following describes the `show ip bgp` command shown in the following example.

Field	Description
Network	Displays the destination network prefix of each BGP route.
Next Hop	Displays the next hop address of the BGP router. If 0.0.0.0 is listed in this column, then local routes exist in the routing table.
Metric	Displays the BGP route's metric, if assigned.
LocPrf	Displays the BGP LOCAL_PREF attribute for the route.
Weight	Displays the route's weight.
Path	Lists all the ASs the route passed through to reach the destination network.

The `show ip bgp` command displays the `dmzlink-dw` details only if `dmzlink-bw` is enabled using the `bgp dmzlink-dw` command.

### Example

```
Dell#show ip bgp
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.5
Status codes: s suppressed, S stale, d dampened, h history, *
valid, > best
Path source: I - internal, a - aggregate, c - confed-external,
r - redistributed
              n - network, D - denied, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete

      Network          Next Hop          Metric    LocPrf
Weight Path
*> 55.0.0.0/24
172.16.0.2              0 200 i
*> 66.0.0.0/24
172.16.0.2              0 200 i
```

All the show and debugs commands display the link band width extended-community prefixed with DMZ-Link-bw along with other extended communities.

```
Dell#show ip bgp 3.3.3.0/24
BGP routing table entry for 3.3.3.0/24
Paths: (1 available, table Default-IP-Routing-Table.)
Not advertised to any peer
Received from :
  1.1.1.2 (3.3.3.1)   Best
    AS_PATH :
    Next-Hop : 1.1.1.2, Cost : 0
    Origin IGP, Metric 0, LocalPref 100, Weight 0, internal
    Extended Communities :
      DMZ-Link Bw: 2000 kbytes*
```

#### Related Commands

[show ip bgp community](#) — views the BGP communities.

[neighbor maximum-prefix](#) — controls the number of network prefixes received.

## show ip bgp cluster-list

View BGP neighbors in a specific cluster.

### S4820T

#### Syntax

```
show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6
unicast] cluster-list [cluster-id]
```

#### Parameters

<b>vrf vrf-name</b>	(OPTIONAL) Enter the keyword <code>vrf</code> and then the name of the VRF to view cluster information of BGP neighbors corresponding to that VRF.
<b>ipv4 multicast</b>	(OPTIONAL) Enter the keywords <code>ipv4</code> followed by the keyword <code>multicast</code> to view information related only to ipv4 multicast routes.
<b>ipv4 unicast</b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>unicast</code> to view information related only to ipv4 multicast routes.
<b>ipv6 unicast</b>	(OPTIONAL) Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to view information related to only to the ipv6 unicast routes.
<b>cluster-id</b>	(OPTIONAL) Enter the cluster id in dotted decimal format. The range is 1 – 4294967295.

#### Command Modes

- EXEC
- EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Added the ipv4 multicast and ipv6 unicast parameters.
9.4.(0.0)	Added support for VRF.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

### Usage Information

The following describes the `show ip bgp cluster-list` command shown in the following example.

Field	Description
Network	Displays the destination network prefix of each BGP route.
Next Hop	Displays the next hop address of the BGP router. If 0.0.0.0 is listed in this column, then local routes exist in the routing table.
Metric	Displays the BGP route's metric, if assigned.
LocPrf	Displays the BGP LOCAL_PREF attribute for the route.
Weight	Displays the route's weight.
Path	Lists all the ASs the route passed through to reach the destination network.

### Example

```
Dell#show ip bgp cluster-list
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.6
Status codes: s suppressed, S stale, d dampened, h history, *
valid, > best
Path source: I - internal, a - aggregate, c - confed-external,
r - redistributed
              n - network, D - denied, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete

      Network          Next Hop          Metric    LocPrf
Weight Path
*>I 55.0.0.0/24        172.16.0.2
0      0 400 500 600 i
*>I 66.0.0.0/24        172.16.0.2
0      0 500 i

Dell#

```

## show ip bgp community

View information on all routes with Community attributes or view specific BGP community groups.

### S4820T

#### Syntax

```

show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6
unicast] community [community-number] [local-as] [no-export]
[no-advertise]

```

#### Parameters

<b>vrf vrf-name</b>	(OPTIONAL) Enter the keywords <code>vrf</code> and then the name of the VRF to view information either on all routes with community attributes or specific BGP community routes corresponding to that VRF.
<b>ipv4 unicast</b>	(OPTIONAL) Enter the keywords <code>ipv4</code> followed by the keyword <code>unicast</code> to view information related only to ipv4 unicast routes.
<b>ipv4 multicast</b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to view information related only to ipv4 multicast routes.
<b>ipv6 unicast</b>	(OPTIONAL) Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to view information related only to ipv6 unicast routes.
<b>community-number</b>	Enter the community number in AA:NN format where AA is the AS number (2 bytes) and NN is a value specific to that autonomous system.  You can specify up to eight community numbers to view information on those community groups.
<b>local-AS</b>	Enter the keywords <code>local-AS</code> to view all routes with the COMMUNITY attribute of NO_EXPORT_SUBCONFED.

All routes with the NO\_EXPORT\_SUBCONFED (0xFFFFFFFF03) community attribute must not be advertised to external BGP peers.

**no-advertise**

Enter the keywords `no-advertise` to view all routes containing the well-known community attribute of NO\_ADVERTISE.

All routes with the NO\_ADVERTISE (0xFFFFFFFF02) community attribute must not be advertised to other BGP peers.

**no-export**

Enter the keywords `no-export` to view all routes containing the well-known community attribute of NO\_EXPORT.

All routes with the NO\_EXPORT (0xFFFFFFFF01) community attribute must not be advertised outside a BGP confederation boundary.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Added the ipv4 multicast and ipv6 unicast parameters.
9.4.(0.0)	Added support for VRF.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information**

To view the total number of COMMUNITY attributes found, use the `show ip bgp summary` command. The text line above the route table states the number of COMMUNITY attributes found.

The `show ip bgp community` command without any parameters lists BGP routes with at least one BGP community attribute and the output is the same as for the `show ip bgp` command output.

The following describes the `show ip bgp community` command shown in the following example.

Field	Description
<b>Network</b>	Displays the destination network prefix of each BGP route.
<b>Next Hop</b>	Displays the next hop address of the BGP router. If 0.0.0.0 is listed in this column, then local routes exist in the routing table.
<b>Metric</b>	Displays the BGP route's metric, if assigned.
<b>LocPrf</b>	Displays the BGP LOCAL_PREF attribute for the route.
<b>Weight</b>	Displays the route's weight.
<b>Path</b>	Lists all the ASs the route passed through to reach the destination network.

### Example

```
Dell#show ip bgp community ?
local-AS          Do not export outside local AS (well-
known community)
no-advertise      Do not advertise to any peer (well-
known community)
no-export         Do not export to next AS (well-known
community)
aa:nn            Community number in aa:nn format
|               Pipe through a command

Dell#show ip bgp community
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0

## show ip bgp community-list

View routes that a specific community list affects.

### S4820T

<b>Syntax</b>	<code>show ip bgp [vrf <i>vrf-name</i>] [ipv4 {<i>unicast</i>   <i>multicast</i>}   ipv6 <i>unicast</i>] community-list <i>community-list-name</i> [exact-match]</code>	
<b>Parameters</b>	<b><i>vrf vrf-name</i></b>	(OPTIONAL) Enter the keywords <code>vrf</code> and then the name of the VRF to view routes affected by a specific community list corresponding to that VRF.
	<b><i>ipv4 unicast</i></b>	(OPTIONAL) Enter the keywords <code>ipv4 unicast</code> to view information only related to ipv4 unicast routes.
	<b><i>ipv4 multicast</i></b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to view information related only to ipv4 multicast routes.
	<b><i>ipv6 unicast</i></b>	(OPTIONAL) Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to view information related only to ipv6 unicast routes.
	<b><i>community-list-name</i></b>	Enter the name of a configured IP community list (maximum 140 characters).
	<b><i>exact-match</i></b>	Enter the keyword for an exact match of the communities.
<b>Command Modes</b>	<ul style="list-style-type: none"><li>EXEC</li><li>EXEC Privilege</li></ul>	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .	

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Added ipv4 multicast and ipv6 unicast parameters.
9.4.(0.0)	Added support for VRF.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.

Version	Description
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

### Usage Information

The `show ip bgp community-list` command without any parameters lists BGP routes matching the Community List and the output is the same as for the `show ip bgp` command output.

The following describes the `show ip bgp community-list pass` command shown in the following example.

Field	Description
<b>Network</b>	Displays the destination network prefix of each BGP route.
<b>Next Hop</b>	Displays the next hop address of the BGP router. If 0.0.0.0 is listed in this column, then local routes exist in the routing table.
<b>Metric</b>	Displays the BGP route's metric, if assigned.
<b>LocPrf</b>	Displays the BGP LOCAL_PREF attribute for the route.
<b>Weight</b>	Displays the route's weight.
<b>Path</b>	Lists all the ASs the route passed through to reach the destination network.

### Example

```
Dell#conf t
Dell(conf)#ip community-list c11
Dell(config-community-list)#permit 1000:1
Dell(config-community-list)#end
Dell#show ip bgp community-list c11
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.5
Status codes: s suppressed, S stale, d dampened, h history, *
valid, > best
Path source: I - internal, a - aggregate, c - confed-external,
r - redistributed
              n - network, D - denied, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete

      Network          Next Hop          Metric      LocPrf
Weight Path
*> 55.0.0.0/24
172.16.0.2                0 200 i
Dell#show ip bgp 55.0.0.0/24
BGP routing table entry for 55.0.0.0/24
Paths: (1 available, table Default-IP-Routing-Table.)
Not advertised to any peer

Received from :
 172.16.0.2 (172.16.0.2)   Best
   AS_PATH : 200

   Next-Hop : 172.16.0.2, Cost : 0
   Origin IGP, Metric 4294967295 (Default), LocalPref 100,
Weight 0, external
```

```
Communities :
 200:1      1000:1      3000:1
```

## show ip bgp dampened-paths

View BGP routes that are dampened (non-active).

### S4820T

**Syntax** `show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast] dampened-paths`

**Parameters**

<b>vrf vrf-name</b>	(OPTIONAL) Enter the keywords <code>vrf</code> and then the name of the VRF to view routes that are affected by a specific community list corresponding to that VRF.
<b>ipv4 multicast</b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to view information related only to ipv4 multicast routes.
<b>ipv4 unicast</b>	(OPTIONAL) Enter the keywords <code>ipv4</code> followed by the keyword <code>unicast</code> to view information related only to ipv4 unicast routes.
<b>ipv6 unicast</b>	(OPTIONAL) Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to view information related only to ipv6 unicast routes.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Added the ipv4 multicast and ipv6 unicast parameters.
9.4(0.0)	Added support for VRF.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.

Version	Description
7.7.1.0	Introduced on the C-Series.

**Usage Information**

To determine a BGP session flap, both a route-down event and a subsequent route-up event corresponding to a single route are considered. As a result, a flap event is penalized only one time during the route-down event. The subsequent route-up event corresponding to the same route is not considered as a flap and is not penalized.

The history paths that the `show ip bgp` command displays contain only the prefix and the next-hop information. The next-hop information shows the ip address of the neighbor. It does not show the actual next-hop details.

The following describes the `show ip bgp damp` command shown in the following example.

Field	Description
<b>Network</b>	Displays the network ID to which the route is dampened.
<b>From</b>	Displays the IP address of the neighbor advertising the dampened route.
<b>Reuse</b>	Displays the hour:minutes:seconds until the dampened route is available.
<b>Path</b>	Lists all the ASs the dampened route passed through to reach the destination network.

**Example**

```
Dell#show ip bgp dampened-paths
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.5
Status codes: s suppressed, S stale, d dampened, h history, *
valid, > best
Path source: I - internal, a - aggregate, c - confed-external,
r - redistributed
              n - network, D - denied, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete

      Network          From           Reuse       Path
d 55.0.0.0/24        172.16.0.2          00:36:23    200

Dell#
```

**show ip bgp dampened-paths**

View BGP routes that are dampened (non-active).

**S4820T**

**Syntax**

```
show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6
unicast] dampened-paths
```

## Parameters

<b>vrf vrf-name</b>	(OPTIONAL) Enter the keywords <code>vrf</code> and then the name of the VRF to view routes that are affected by a specific community list corresponding to that VRF.
<b>ipv4 multicast</b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to view information related only to ipv4 multicast routes.
<b>ipv4 unicast</b>	(OPTIONAL) Enter the keywords <code>ipv4</code> followed by the keyword <code>unicast</code> to view information related only to ipv4 unicast routes.
<b>ipv6 unicast</b>	(OPTIONAL) Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to view information related only to ipv6 unicast routes.

## Command Modes

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Added the ipv4 multicast and ipv6 unicast parameters.
9.4(0.0)	Added support for VRF.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

## Usage Information

To determine a BGP session flap, both a route-down event and a subsequent route-up event corresponding to a single route are considered. As a result, a flap event is penalized only one time during the route-down event. The subsequent route-up event corresponding to the same route is not considered as a flap and is not penalized.

The history paths that the `show ip bgp` command displays contain only the prefix and the next-hop information. The next-hop information shows the ip address of the neighbor. It does not show the actual next-hop details.

The following describes the `show ip bgp damp` command shown in the following example.

Field	Description
<b>Network</b>	Displays the network ID to which the route is dampened.
<b>From</b>	Displays the IP address of the neighbor advertising the dampened route.
<b>Reuse</b>	Displays the hour:minutes:seconds until the dampened route is available.
<b>Path</b>	Lists all the ASs the dampened route passed through to reach the destination network.

### Example

```
Dell#show ip bgp dampened-paths
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.5
Status codes: s suppressed, S stale, d dampened, h history, *
valid, > best
Path source: I - internal, a - aggregate, c - confed-external,
r - redistributed
              n - network, D - denied, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete

      Network          From          Reuse      Path
d 55.0.0.0/24        172.16.0.2          00:36:23    200

Dell#
```

## show ip bgp detail

Display BGP internal information for the IPv4 Unicast address family.

### S4820T

**Syntax** `show ip bgp [ipv4 unicast] detail`

**Defaults** none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.

Version	Description
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.5.1.0	Introduced.

### Example

```

## show ip bgp extcommunity-list

View information on all routes with Extended Community attributes.

### S4820T

**Syntax** `show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast] extcommunity-list [list name]`

**Parameters**

<b>vrf vrf-name</b>	(OPTIONAL) Enter the keywords <code>vrf</code> and then the name of the VRF to view information on all routes with extended community attributes corresponding to that VRF.
---------------------	---

<b>ipv4 multicast</b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to view information related only to ipv4 multicast routes.
<b>ipv4 unicast</b>	(OPTIONAL) Enter the keywords <code>ipv4 unicast</code> to view information only related to ipv4 unicast routes.
<b>ipv6 unicast</b>	(OPTIONAL) Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to view information related only to ipv6 unicast routes.
<b>list name</b>	Enter the extended community list name you wish to view. The range is 140 characters.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Added the ipv4 multicast and ipv6 unicast parameters.
9.4.(0.0)	Added support for VRF.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information**

To view the total number of COMMUNITY attributes found, use the `show ip bgp summary` command. The text line above the route table states the number of COMMUNITY attributes found.

The `show ip bgp community` command without any parameters lists BGP routes with at least one BGP community attribute and the output is the same as for the `show ip bgp` command output.

**Example**

```
Dell#show run extcommunity-list
!
ip extcommunity-list ecl1
  permit rt 100:4
  permit soo 40:4
Dell#show ip bgp extcommunity-list ecl1
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.5
```

```

Status codes: s suppressed, S stale, d dampened, h history, *

Dell#

```

## show ip bgp filter-list

View the routes that match the filter lists.

### S4820T

<b>Syntax</b>	<code>show ip bgp [vrf vrf-name] [ipv4 {multicast   unicast}   ipv6 unicast] filter-list as-path-name</code>	
<b>Parameters</b>	<b>vrf vrf-name</b>	(OPTIONAL) Enter the keyword <code>vrf</code> and then the name of the VRF to view route information that matches the filter lists corresponding to that VRF.
	<b>ipv4 multicast</b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to view information related only to ipv4 multicast routes.
	<b>ipv4 unicast</b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>unicast</code> to view information related only to ipv4 unicast routes.
	<b>ipv6 unicast</b>	(OPTIONAL) Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to view information related only to ipv6 unicast routes.
	<b>as-path-name</b>	Enter an AS-PATH access list name. The range is 140 characters.
<b>Command Modes</b>	<ul style="list-style-type: none"> <li>• EXEC</li> <li>• EXEC Privilege</li> </ul>	
<b>Command History</b>	<p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p>	

Version	Description
9.7(0.0)	Added the ipv4 multicast and ipv6 unicast parameters.
9.4.(0.0)	Added support for VRF.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

### Usage Information

The following describes the `show ip bgp filter-list hello` command shown in the following example.

Field	Description
<b>Path source codes</b>	Lists the path sources shown to the right of the last AS number in the Path column: <ul style="list-style-type: none"> <li>• i = internal route entry</li> <li>• a = aggregate route entry</li> <li>• c = external confederation route entry</li> <li>• n = network route entry</li> <li>• r = redistributed route entry</li> </ul>
<b>Next Hop</b>	Displays the next hop address of the BGP router. If 0.0.0.0 is listed in this column, then local routes exist in the routing table.
<b>Metric</b>	Displays the BGP route's metric, if assigned.
<b>LocPrf</b>	Displays the BGP LOCAL_PREF attribute for the route.
<b>Weight</b>	Displays the route's weight.
<b>Path</b>	Lists all the ASs the route passed through to reach the destination network.

### Example

```
Dell#show run as-path a1
!
ip as-path access-list a1
 permit 500
Dell#

Dell#show ip bgp filter-list a1
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.5
Status codes: s suppressed, S stale, d dampened, h history, *
valid, > best
Path source: I - internal, a - aggregate, c - confed-external,
r - redistributed
           n - network, D - denied, S - stale
```

Origin codes: i - IGP, e - EGP, ? - incomplete

Network	Next Hop	Metric	LocPrf
Weight Path			
*> 55.0.0.0/24			
172.16.0.2		0 200 400 500 600	i
*> 66.0.0.0/24			
172.16.0.2		0 200 500	i

## show ip bgp flap-statistics

View flap statistics on BGP routes.

### S4820T

#### Syntax

```
show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast] flap-statistics [ip-address [mask]] [filter-list as-path-name] [regexp regular-expression]
```

#### Parameters

<b>vrf vrf-name</b>	(OPTIONAL) Enter the keywords <code>vrf</code> and then the name of the VRF to view flap statistics on BGP routes corresponding to that VRF.
<b>ipv4 multicast</b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to view information related only to ipv4 multicast routes.
<b>ipv4 unicast</b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>unicast</code> to view information related only to ipv4 unicast routes.
<b>ipv6 unicast</b>	(OPTIONAL) Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to view information related only to ipv6 unicast routes.
<b>ip-address</b>	(OPTIONAL) Enter the IP address (in dotted decimal format) of the BGP network to view information only on that network.
<b>mask</b>	(OPTIONAL) Enter the network mask (in slash prefix (/x) format) of the BGP network address.
<b>filter-list as-path-name</b>	(OPTIONAL) Enter the keyword <code>filter-list</code> then the name of a configured AS-PATH ACL. The range is 140 characters.
<b>regexp regular-expression</b>	Enter a regular expression then use one or a combination of the following characters to match. The range is 256 characters. <ul style="list-style-type: none"><li>• <code>.</code> = (period) any single character (including a white space).</li><li>• <code>*</code> = (asterisk) the sequences in a pattern (zero or more sequences).</li></ul>

- + = (plus) the sequences in a pattern (one or more sequences).
- ? = (question mark) sequences in a pattern (either zero or one sequences).

**NOTE:** Enter an escape sequence (CTRL+v) prior to entering the ? regular expression.

- [ ] = (brackets) a range of single-character patterns.
- ( ) = (parenthesis) groups a series of pattern elements to a single element.
- { } = (braces) minimum and the maximum match count.
- ^ = (caret) the beginning of the input string. If you use the caret at the beginning of a sequence or range, it matches on everything BUT the characters specified.
- \$ = (dollar sign) the end of the output string.

### Command Modes

- EXEC
- EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Added the ipv4 multicast and ipv6 unicast parameters.
9.4.(0.0)	Added support for VRF.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

### Usage Information

The following describes the `show ip bgp flap` command shown in the following example.

Field	Description
<b>Network</b>	Displays the network ID to which the route is flapping.
<b>From</b>	Displays the IP address of the neighbor advertising the flapping route.
<b>Flaps</b>	Displays the number of times the route flapped.

Field	Description
Duration	Displays the hours:minutes:seconds since the route first flapped.
Reuse	Displays the hours:minutes:seconds until the flapped route is available.
Path	Lists all the ASs the flapping route passed through to reach the destination network.

### Example

```
Dell#show ip bgp flap-statistics
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.5
Status codes: s suppressed, S stale, d dampened, h history, *
valid, > best
Path source: I - internal, a - aggregate, c - confed-external,
r - redistributed
              n - network, D - denied, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete

      Network          From          Flaps
Duration  Reuse    Path

```

## show ip bgp inconsistent-as

View routes with inconsistent originating autonomous system (AS) numbers; that is, prefixes that are announced from the same neighbor AS but with a different AS-Path.

### S4820T

<b>Syntax</b>	<code>show ip bgp [vrf vrf-name] [ipv4 unicast] inconsistent-as</code>	
<b>Parameters</b>	<b>vrf vrf-name</b>	(OPTIONAL) Enter the keyword <code>vrf</code> and then the name of the VRF to view routes corresponding to the VRF that contain inconsistent originating AS numbers.
	<b>ipv4 unicast</b>	(OPTIONAL) Enter the keywords <code>ipv4 unicast</code> to view information only related to ipv4 unicast routes.
<b>Command Modes</b>	<ul style="list-style-type: none"> <li>EXEC</li> <li>EXEC Privilege</li> </ul>	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .	

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.4.(0.0)	Added support for VRF.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

### Usage Information

The following describes the `show ip bgp inconsistent-as` command shown in the following example.

Field	Description
Network	Displays the destination network prefix of each BGP route.
Next Hop	Displays the next hop address of the BGP router. If 0.0.0.0 is listed in this column, then local routes exist in the routing table.
Metric	Displays the BGP route's metric, if assigned.
LocPrf	Displays the BGP LOCAL_PREF attribute for the route.
Weight	Displays the route's weight.
Path	Lists all the ASs the route passed through to reach the destination network.

### Example

```
Dell>show ip bgp inconsistent-as
BGP table version is 280852, local router ID is 10.1.2.100
Status codes: s suppressed, d damped, h history, * valid, >

## show ip bgp neighbors

Allows you to view the information BGP neighbors exchange.

### S4820T

#### Syntax

```

show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6
unicast] neighbors [ip-address [advertised-routes | dampened-
routes | detail | flap-statistics | routes | {received-routes
[network [network-mask]]] | {denied-routes [network [network-
mask]]}}]

```

#### Parameters

***vrf vrf-name*** (OPTIONAL) Enter the keyword `vrf` and then the name of the VRF to view information exchanged by BGP neighbors corresponding to that VRF.

**NOTE:** You can use this attribute to view information exchanged by BGP neighbors that correspond to either a default or a non-default VRF.

***ipv4 multicast*** (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `multicast` to view information related only to `ipv4` multicast routes.

<b>ipv4 unicast</b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>unicast</code> to view information related only to ipv4 unicast routes.
<b>ipv6 unicast</b>	(OPTIONAL) Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to view information related only to ipv6 unicast routes.
<b>ip-address</b>	(OPTIONAL) Enter the IP address of the neighbor to view only BGP information exchanged with that neighbor.
<b>advertised-routes</b>	(OPTIONAL) Enter the keywords <code>advertised-routes</code> to view only the routes the neighbor sent.
<b>dampened-routes</b>	(OPTIONAL) Enter the keywords <code>dampened-routes</code> to view information on dampened routes from the BGP neighbor.
<b>detail</b>	(OPTIONAL) Enter the keyword <code>detail</code> to view neighbor-specific internal information for the IPv4 Unicast address family.
<b>flap-statistics</b>	(OPTIONAL) Enter the keywords <code>flap-statistics</code> to view flap statistics on the neighbor's routes.
<b>routes</b>	(OPTIONAL) Enter the keyword <code>routes</code> to view only the neighbor's feasible routes.
<b>received-routes</b> <b>[network</b> <b>[network-mask]</b>	(OPTIONAL) Enter the keywords <code>received-routes</code> then either the network address (in dotted decimal format) or the network mask (in slash prefix format) to view all information received from neighbors.
	 <b>NOTE:</b> Configure the <code>neighbor soft-reconfiguration inbound</code> command prior to viewing all the information received from the neighbors.
<b>denied-routes</b> <b>[network</b> <b>[network-mask]</b>	(OPTIONAL) Enter the keywords <code>denied-routes</code> then either the network address (in dotted decimal format) or the network mask (in slash prefix format) to view all information on routes denied via neighbor inbound filters.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Added the ipv4 multicast and ipv6 unicast parameters.
9.4.(0.0)	Added support for VRF.

Version	Description
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.8.0	Added the <code>add-path</code> option to the S4810. Output on the S4810 shows the ADDPATH parameters.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.5.1.0	Added the <code>detail</code> option. Output now displays the default MED value.
7.2.1.0	Added the <code>received</code> and <code>denied route</code> options.
6.3.10	The output is changed to display the total number of advertised prefixes.

## Usage Information

After a peer reset, the contents of the notification log messages is displayed in hex values for debugging.

The neighbor information that this command displays does not include counts corresponding to ignored prefixes and updates. However, the martian case is an exception where neighbor information corresponding to ignored updates is displayed.

BGP shows the exact information that is exchanged between the BGP peers. It also indicates whether or not this information is received by the BGP peer.

The following describes the `show ip bgp neighbors` command shown in the following examples.

The Lines Beginning with:	Description
<b>BGP neighbor</b>	Displays the BGP neighbor address and its AS number. The last phrase in the line indicates whether the link between the BGP router and its neighbor is an external or internal one. If they are located in the same AS, the link is internal; otherwise the link is external.
<b>BGP version</b>	Displays the BGP version (always version 4) and the remote router ID.
<b>BGP state</b>	Displays the neighbor's BGP state and the amount of time in hours:minutes:seconds it has been in that state.
<b>Last read</b>	This line displays the following information: <ul style="list-style-type: none"> <li>last read is the time (hours:minutes:seconds) the router read a message from its neighbor</li> </ul>

<b>The Lines Beginning with:</b>	<b>Description</b>
	<ul style="list-style-type: none"> <li>• hold time is the number of seconds configured between messages from its neighbor</li> <li>• keepalive interval is the number of seconds between keepalive messages to help ensure that the TCP session is still alive.</li> </ul>
<b>Received messages</b>	This line displays the number of BGP messages received, the number of notifications (error messages), and the number of messages waiting in a queue for processing.
<b>Sent messages</b>	The line displays the number of BGP messages sent, the number of notifications (error messages), and the number of messages waiting in a queue for processing.
<b>Received updates</b>	This line displays the number of BGP updates received and sent.
<b>Soft reconfiguration</b>	This line indicates that soft reconfiguration inbound is configured.
<b>Minimum time</b>	Displays the minimum time, in seconds, between advertisements.
<b>(list of inbound and outbound policies)</b>	Displays the policy commands configured and the names of the Route map, AS-PATH ACL, or Prefix list configured for the policy.
<b>For address family:</b>	Displays the IPv4 Unicast as the address family.
<b>BGP table version</b>	Displays which version of the primary BGP routing table the router and the neighbor are using.
<b>accepted prefixes</b>	Displays the number of network prefixes the router accepts and the amount of memory used to process those prefixes.
<b>Prefix advertised</b>	Displays the number of network prefixes advertised, the number rejected, and the number withdrawn from the BGP routing table.
<b>Connections established</b>	Displays the number of TCP connections established and dropped between the two peers to exchange BGP information.
<b>Last reset</b>	Displays the amount of time since the peering session was last reset. Also states if the peer resets the peering session. If the peering session was never reset, the word never is displayed.
<b>Local host:</b>	Displays the peering address of the local router and the TCP port number.

The Lines	Description
<b>Beginning with:</b>	
<b>Foreign host:</b>	Displays the peering address of the neighbor and the TCP port number.

### Example

```
Dell#show ip bgp neighbors 172.16.0.2
BGP neighbor is 172.16.0.2, remote AS 200, external link
  Member of peer-group port0 for session parameters
  BGP remote router ID 172.16.0.2
  BGP state ESTABLISHED, in this state for 00:13:55
  Last read 00:00:03, Last write 00:00:55
  Hold time is 180, keepalive interval is 60 seconds
  Received 50 messages, 0 in queue
    1 opens, 0 notifications, 34 updates
    15 keepalives, 0 route refresh requests
  Sent 18 messages, 0 in queue
    1 opens, 0 notifications, 0 updates
    16 keepalives, 0 route refresh requests

  Route refresh request: received 0, sent messages 1
  Minimum time between advertisement runs is 30 seconds
  Minimum time before advertisements start is 0 seconds

  Capabilities received from neighbor for IPv4 Unicast :
    MULTIPROTO_EXT(1)
    ROUTE_REFRESH(2)

  Capabilities advertised to neighbor for IPv4 Unicast :
    MULTIPROTO_EXT(1)
    ROUTE_REFRESH(2)
    ADD_PATH(69)
    CISCO_ROUTE_REFRESH(128)

  For address family: IPv4 Unicast
  BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
  InQ : Added 0, Replaced 0, Withdrawn 0
  OutQ : Added 0, Withdrawn 0
  Allow local AS number 0 times in AS-PATH attribute
  Prefixes accepted 2, withdrawn 15 by peer, martian prefixes
  ignored 0
  Prefixes advertised 0, denied 0, withdrawn 0 from peer

  Connections established 1; dropped 0
  Last reset never
  Local host: 172.16.0.1, Local port: 58145
  Foreign host: 172.16.0.2, Foreign port: 179

Dell#
```

### Related Commands

[show ip bgp](#) — views the current BGP routing table.

## show ip bgp next-hop

View all next hops (using learned routes only) with current reachability and flap status. This command only displays one path, even if the next hop is reachable by multiple paths.

### S4820T

**Syntax** `show ip bgp [vrf vrf-name] next-hop`

**Parameters**

<b>vrf vrf-name</b>	Enter the keyword <code>vrf</code> followed by the name of the VRF to view all next hops corresponding to that VRF.
---------------------	---

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.4.(0.0)	Added support for VRF.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information** The following describes the `show ip bgp next-hop` command shown in the following example.

Field	Description
<b>Next-hop</b>	Displays the next-hop IP address.
<b>Via</b>	Displays the IP address and interface used to reach the next hop.
<b>RefCount</b>	Displays the number of BGP routes using this next hop.
<b>Cost</b>	Displays the cost associated with using this next hop.
<b>Flaps</b>	Displays the number of times the next hop has flapped.

Field	Description
Time Elapsed	Displays the time elapsed since the next hop was learned. If the route is down, this field displays time elapsed since the route went down.

**Example**

```
Dell# show ip bgp next-hop
      Next-hop      Resolved
      172.16.0.2    YES
Dell#
```

## show ip bgp paths

View all the BGP path attributes in the BGP database.

**Syntax** `show ip bgp[vrf vrf-name] paths [regexp regular-expression]`

**Parameters**

**vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` to view all path attributes in the BGP database corresponding to that VRF.

**NOTE:** Description You can use this attribute to view information on all path attributes in the BGP database that correspond to either a default or a non-default VRF.

**regexp regular-expression** Enter a regular expression then use one or a combination of the following characters to match:

- `.` = (period) any single character (including a white space).
- `*` = (asterisk) the sequences in a pattern (zero or more sequences).
- `+` = (plus) the sequences in a pattern (one or more sequences).
- `?` = (question mark) sequences in a pattern (either zero or one sequences).

**NOTE:** Enter an escape sequence (CTRL+v) prior to entering the `?` regular expression.

- `[ ]` = (brackets) a range of single-character patterns.
- `( )` = (parenthesis) groups a series of pattern elements to a single element.
- `{ }` = (braces) minimum and the maximum match count.
- `^` = (caret) the beginning of the input string. If you use the caret at the beginning of a sequence or range, it matches on everything BUT the characters specified.
- `$` = (dollar sign) the end of the output string.

**Command Modes**

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.4(0.0)	Added support for VRF for the S4810, S4820T, and S6000.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

## Usage Information

The following describes the `show ip bgp path` command shown in the following example.

Field	Description
Total	Displays the total number of BGP path attributes.
Address	Displays the internal address where the path attribute is stored.
Hash	Displays the hash bucket where the path attribute is stored.
Refcount	Displays the number of BGP routes using this path attribute.
Metric	Displays the MED attribute for this path attribute.
Path	Displays the AS path for the route, with the origin code for the route listed last. Numbers listed between braces {} are AS_SET information.

## Example

```
Dell#show ip bgp paths ?
community          Display community information
extcommunity       Display extended community information
regexp             Display path information based on a
regular expression
|                 Pipe through a command

Dell#show ip bgp paths
Total 2 Paths
Refcount Metric Path
1          0          200 i
1          0          200 i
```

## show ip bgp paths community

View all unique COMMUNITY numbers in the BGP database.

### S4820T

**Syntax** `show ip bgp [vrf vrf-name] paths community`

**Parameters**

<b>vrf vrf-name</b>	(OPTIONAL) Enter the keyword <code>vrf</code> to view all unique COMMUNITY numbers in the BGP database corresponding to that VRF.
---------------------	---

**NOTE:** You can use this attribute to view information on unique COMMUNITY numbers in a BGP database that correspond to either a default or a non-default VRF.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.4.(0.0)	Added support for VRF.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information** The following describes the `show ip bgp paths community` command shown in the following example.

Field	Description
<b>Address</b>	Displays the internal address where the path attribute is stored.
<b>Hash</b>	Displays the hash bucket where the path attribute is stored.

Field	Description
Refcount	Displays the number of BGP routes using these communities.
Community	Displays the community attributes in this BGP path.

#### Example

```
Dell#show ip bgp paths community
Total 2 communities
Refcount  Community
1        NO-ADVERTISE
1        200:1          1000:1          3000:1
```

## show ip bgp peer-group

Allows you to view information on the BGP peers in a peer group.

### S4820T

#### Syntax

```
show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast}] | [ipv6 unicast] peer-group [peer-group-name [detail | summary]]
```

#### Parameters

<b>vrf vrf-name</b>	(OPTIONAL) Enter the keyword <code>vrf</code> to view information on BGP peers in a peer group corresponding to that VRF.
	 <b>NOTE:</b> You can use this attribute to view information on BGP peers in a peer group that correspond to either a default or a non-default VRF.
<b>ipv4 multicast</b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to view information related only to ipv4 multicast routes.
<b>ipv4 unicast</b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>unicast</code> to view information related only to ipv4 unicast routes.
<b>ipv6 unicast</b>	(OPTIONAL) Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to view information related only to ipv6 unicast routes.
<b>peer-group-name</b>	(OPTIONAL) Enter the name of a peer group to view information about that peer group only.
<b>detail</b>	(OPTIONAL) Enter the keyword <code>detail</code> to view detailed status information of the peers in that peer group.
<b>summary</b>	(OPTIONAL) Enter the keyword <code>summary</code> to view status information of the peers in that peer group. The output is the same as that found in the <code>show ip bgp summary</code> command.

## Command Modes

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Added the ipv4 multicast and ipv6 unicast parameters. Introduced on S6000-ON.
9.4(0.0)	Added support for VRF.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.8.0	Added the <code>add-path</code> option to the S4810. Output on the S4810 shows the ADDPATH parameters.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

## Usage Information

The following describes the `show ip bgp peer-group` command shown in the following example.

Line beginning with:	Description
<b>Peer-group</b>	Displays the peer group's name.
<b>Administratively shut</b>	Displays the peer group's status if the peer group is not enabled. If you enable the peer group, this line is not displayed.
<b>BGP version</b>	Displays the BGP version supported.
<b>Minimum time</b>	Displays the time interval between BGP advertisements.
<b>For address family</b>	Displays IPv4 Unicast as the address family.
<b>BGP neighbor</b>	Displays the name of the BGP neighbor.
<b>Number of peers</b>	Displays the number of peers currently configured for this peer group.
<b>Peer-group members:</b>	Lists the IP addresses of the peers in the peer group. If the address is outbound optimized, an * is displayed next to the IP address.

## Example

```
Dell#show ip bgp peer-group
Peer-group port0, remote AS 200
```

```
BGP version 4
Minimum time between advertisement runs is 30 seconds
For address family: IPv4 Unicast
BGP neighbor is port0, peer-group external
Update packing has 4_OCTET_AS support enabled
```

```
Number of peers in this group 1
Maximum limit on the accepted connections 256
```

```
Peer-group members (* - outbound optimized):
172.16.0.2
Dell#
```

#### Related Commands

[neighbor peer-group \(assigning peers\)](#) — assigns a peer to a peer-group.

[neighbor peer-group \(creating group\)](#) — creates a peer group.

## show ip bgp regexp

Display the subset of the BGP routing tables matching the regular expressions specified.

### S4820T

#### Syntax

```
show ip bgp [vrf vrf-name] regexp regular-expression
[character]
```

#### Parameters

##### *vrf vrf-name*

Enter the keyword `vrf` and then the name of the VRF to view the subset of BGP routing tables that match the regular expression specified on that VRF.

**NOTE:** You can use this attribute to view the subset of BGP routing tables that match the regular expression that is specified on either a default or a non-default VRF.

##### *regular-expression* [*character*]

Enter a regular expression then use one or a combination of the following characters to match:

- `.` = (period) any single character (including a white space).
- `*` = (asterisk) the sequences in a pattern (zero or more sequences).
- `+` = (plus) the sequences in a pattern (one or more sequences).
- `?` = (question mark) sequences in a pattern (either zero or one sequences).

**NOTE:** Enter an escape sequence (CTRL+v) prior to entering the `?` regular expression.

- `[ ]` = (brackets) a range of single-character patterns.
- `( )` = (parenthesis) groups a series of pattern elements to a single element.
- `{ }` = (braces) minimum and the maximum match count.

- ^ = (caret) the beginning of the input string. If you use the caret at the beginning of a sequence or range, it matches on everything BUT the characters specified.
- \$ = (dollar sign) the end of the output string.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.4.(0.0)	Added support for VRF.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information**

The following describes the `show ip bgp regexp` command shown in the following example.

Field	Description
<b>Network</b>	Displays the destination network prefix of each BGP route.
<b>Next Hop</b>	Displays the next hop address of the BGP router. If 0.0.0.0 is listed in this column, then non-BGP routes exist in the router's routing table.
<b>Metric</b>	Displays the BGP router's metric, if assigned.
<b>LocPrf</b>	Displays the BGP LOCAL_PREF attribute for the route.
<b>Weight</b>	Displays the route's weight
<b>Path</b>	Lists all the AS paths the route passed through to reach the destination network.

**Example**

```
Dell#show ip bgp regexp ^200
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.5
Status codes: s suppressed, S stale, d dampened, h history, *
valid, > best
Path source: I - internal, a - aggregate, c - confed-external,
```

```

r - redistributed
      n - network, D - denied, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete

      Network          Next Hop          Metric      LocPrf
Weight Path
*> 55.0.0.0/24
172.16.0.2              0 200 i
*> 66.0.0.0/24
172.16.0.2              0 200 i

```

## show ip bgp summary

Allows you to view the status of all BGP connections.

### S4820T

**Syntax** `show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast] summary`

**Parameters**

<b>vrf <i>vrf-name</i></b>	(OPTIONAL) Enter the keyword <code>vrf</code> and then the name of the VRF to view the status of all BGP connections corresponding to that VRF.
<b>ipv4 <i>multicast</i></b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to view information related only to ipv4 multicast routes.
<b>ipv4 <i>unicast</i></b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>unicast</code> to view information related only to ipv4 unicast routes.
<b>ipv6 <i>unicast</i></b>	(OPTIONAL) Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to view information related only to ipv6 unicast routes.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Added the ipv4 multicast and ipv6 unicast parameters.
9.4.(0.0)	Added support for VRF.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.

Version	Description
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

## Usage Information

In BGP, route attributes are maintained at different locations. When attributes that correspond to multiple routes change, then attribute counts that the `show ip bgp summary` command displays are calculated as summations of attributes corresponding to all the associated routes. For example, if `cluster_id` is an attribute associated with thousand routes that contain exactly the same set of attributes, then the `cluster_id` count is 1. If these thousand routes are set with different attribute values with the same `cluster_id`, then the `cluster_id` count is 1000, since the same value is stored for thousand different attribute records.

The attribute next-hop is a part of the BGP attribute data structure.

If two peers send the same route that contains similar path attributes, then two entries are maintained in the back-end, as both these entries have different next-hops. If this same route is sent to a different peer, an entry for each peer is created, as the next-hop is different. As a result, the BGP attributes count in the summary output will differ accordingly.

The following describes the `show ip bgp summary` command shown in the following example.

Field	Description
<b>BGP router identifier</b>	Displays the local router ID and the AS number.
<b>BGP table version</b>	Displays the BGP table version and the main routing table version.
<b>network entries</b>	Displays the number of network entries, route paths, and the amount of memory used to process those entries.
<b>paths</b>	Displays the number of paths and the amount of memory used.
<b>denied paths</b>	Displays the number of denied paths and the amount of memory used.
<b>BGP path attribute entries</b>	Displays the number of BGP path attributes and the amount of memory used to process them.
<b>BGP AS-PATH entries</b>	Displays the number of BGP AS_PATH attributes processed and the amount of memory used to process them.
<b>BGP community entries</b>	Displays the number of BGP COMMUNITY attributes processed and the amount of memory used to process

<b>Field</b>	<b>Description</b>								
	them. The <code>show ip bgp community</code> command provides more details on the COMMUNITY attributes.								
<b>Dampening enabled</b>	Displayed only when you enable dampening. Displays the number of paths designated as history, dampened, or penalized.								
<b>Neighbor</b>	Displays the BGP neighbor address.								
<b>AS</b>	Displays the AS number of the neighbor.								
<b>MsgRcvd</b>	Displays the number of BGP messages that neighbor received.								
<b>MsgSent</b>	Displays the number of BGP messages that neighbor sent.								
<b>TblVer</b>	Displays the version of the BGP table that was sent to that neighbor.								
<b>InQ</b>	Displays the number of messages from that neighbor waiting to be processed.								
<b>OutQ</b>	Displays the number of messages waiting to be sent to that neighbor. If a number appears in parentheses, the number represents the number of messages waiting to be sent to the peer group.								
<b>Up/Down</b>	<p>Displays the amount of time that the neighbor is in the Established stage. If the neighbor has never moved into the Established stage, the word never is displayed.</p> <p>The output format is:</p> <table border="0" style="margin-left: 40px;"> <thead> <tr> <th style="text-align: left;"><b>Time Established</b></th> <th style="text-align: left;"><b>Display Example</b></th> </tr> </thead> <tbody> <tr> <td>&lt; 1 day</td> <td>00:12:23 (hours:minutes:seconds)</td> </tr> <tr> <td>&lt; 1 week</td> <td>1d21h (DaysHours)</td> </tr> <tr> <td>&gt; 1 week</td> <td>11w2d (WeeksDays)</td> </tr> </tbody> </table>	<b>Time Established</b>	<b>Display Example</b>	< 1 day	00:12:23 (hours:minutes:seconds)	< 1 week	1d21h (DaysHours)	> 1 week	11w2d (WeeksDays)
<b>Time Established</b>	<b>Display Example</b>								
< 1 day	00:12:23 (hours:minutes:seconds)								
< 1 week	1d21h (DaysHours)								
> 1 week	11w2d (WeeksDays)								
<b>State/Pfxrcd</b>	<p>If the neighbor is in Established stage, the number of network prefixes received.</p> <p>If a maximum limit was configured with the <code>neighbor maximum-prefix</code> command, (prfxd) appears in this column.</p> <p>If the neighbor is not in Established stage, the current stage is displayed (Idle, Connect, Active, OpenSent, OpenConfirm). When the peer is transitioning between states and clearing the routes received, the phrase (Purging) may appear in this column.</p>								

Field	Description
	If the neighbor is disabled, the phrase (Admin shut) appears in this column.

**Example**

```
Dell#show ip bgp summary
BGP router identifier 192.168.11.5, local AS number 100
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
2 network entrie(s) using 152 bytes of memory
2 paths using 208 bytes of memory
BGP-RIB over all using 210 bytes of memory
2 BGP path attribute entrie(s) using 144 bytes of memory
1 BGP AS-PATH entrie(s) using 10 bytes of memory
2 neighbor(s) using 16384 bytes of memory

Neighbor      AS      MsgRcvd  MsgSent   TblVer
InQ  OutQ  Up/Down  State/Pfx
172.16.0.2    200          10         8         0
0           0 00:05:34 2
192.168.10.2  100           0         22         0
0           0 00:00:00 (shut)
Dell#
```

**show running-config bgp**

To display the current BGP configuration, use this feature.

**S4820T**

<b>Syntax</b>	show running-config bgp
<b>Defaults</b>	none
<b>Command Modes</b>	EXEC Privilege
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

Version	Description
7.6.1.0	Introduced on the E-Series.

**Example**

```
Dell#show running-config bgp
!
router bgp 100
 network 1.1.11.1/32
 network 1.1.12.1/32
 network 1.1.13.1/32
 neighbor 10.1.1.2 remote-as 200
 neighbor 10.1.1.2 no shutdown
Dell#
```

## timers bgp

Adjust the BGP Keep Alive and Hold Time timers.

### S4820T

**Syntax** `timers bgp keepalive holdtime`  
 To return to the default, use the `no timers bgp` command.

**Parameters**

<b><i>keepalive</i></b>	Enter a number for the time interval, in seconds, between keepalive messages sent to the neighbor routers. The range is from 1 to 65535. The default is <b>60 seconds</b> .
<b><i>holdtime</i></b>	Enter a number for the time interval, in seconds, between the last keepalive message and declaring the router dead. The range is from 3 to 65535. The default is <b>180 seconds</b> .

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.

Version	Description
7.7.1.0	Introduced on the C-Series.
7.6.1.0	Introduced on the E-Series.

## MBGP Commands

Multiprotocol BGP (MBGP) is an enhanced BGP that enables multicast routing policy throughout the internet and connecting multicast topologies between BGP and autonomous systems (ASs). Dell Networking OS MBGP is implemented as per IETF RFC 1858.

BGPv4 is supported in the following:

Dell Networking OS Version	Platform Support
7.8.1.0, MBGP for IPv4 Multicast Only	S-Series

### debug ip bgp dampening

View information on routes being dampened.

#### S4820T

**Syntax** `debug ip bgp [vrf vrf-name] [ipv4 {unicast | multicast}] | ipv6 unicast] dampening`

To disable debugging, use the `no debug ip bgp dampening` command.

#### Parameters

<b><i>vrf vrf-name</i></b>	Enter the keyword <code>vrf</code> followed by the name of the VRF to view information on dampened routes corresponding to that VRF.
<b><i>ipv4 multicast</i></b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>multicast</code> to view dampened-route information related only to <code>ipv4</code> multicast routes.
<b><i>ipv4 unicast</i></b>	(OPTIONAL) Enter the keyword <code>ipv4</code> followed by the keyword <code>unicast</code> to view dampened-route information related only to <code>ipv4</code> unicast routes.
<b><i>ipv6 unicast</i></b>	(OPTIONAL) Enter the keyword <code>ipv6</code> followed by the keyword <code>unicast</code> to view dampened-route information related only to <code>ipv6</code> unicast routes.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

b

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.6.1.0	Introduced IPv6 MGBP support for the E-Series.

## distance bgp

Configure three administrative distances for routes.

### S4820T

**Syntax**

`distance bgp external-distance internal-distance local-distance`  
To return to default values, use the `no distance bgp` command.

**Parameters**

<i>external-distance</i>	Enter a number to assign to routes learned from a neighbor external to the AS. The range is from 1 to 255. The default is <b>20</b> .
<i>internal-distance</i>	Enter a number to assign to routes learned from a router within the AS. The range is from 1 to 255. The default is <b>200</b> .
<i>local-distance</i>	Enter a number to assign to routes learned from networks listed in the network command. The range is from 1 to 255. The default is <b>200</b> .

**Defaults**

- external-distance = **20**
- internal-distance = **200**
- local-distance = **200**

**Command Modes** ROUTER BGP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

**Version 8.3.19.0** Introduced on the S4820T.

**Version 8.3.7.0** Introduced on the S4810.

**Version 7.8.1.0** Introduced on the S-Series.

**Version 7.7.1.0** Introduced on the C-Series.

**Usage Information**

**CAUTION: Dell Networking recommends not changing the administrative distance of internal routes. Changing the administrative distances may cause routing table inconsistencies.**

The higher the administrative distance assigned to a route means that your confidence in that route is low. Routes assigned an administrative distance of 255 are not installed in the routing table. Routes from confederations are treated as internal BGP routes.

**Related Commands**

[router bgp](#) — enters ROUTER mode on the switch.

## show ip bgp dampened-paths

View BGP routes that are dampened (non-active).

### S4820T

**Syntax** `show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast] dampened-paths`

**Parameters**

**vrf vrf-name** (OPTIONAL) Enter the keywords `vrf` and then the name of the VRF to view routes that are affected by a specific community list corresponding to that VRF.

**ipv4 multicast** (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `multicast` to view information related only to ipv4 multicast routes.

**ipv4 unicast** (OPTIONAL) Enter the keywords `ipv4` followed by the keyword `unicast` to view information related only to ipv4 unicast routes.

**ipv6 unicast** (OPTIONAL) Enter the keyword `ipv6` followed by the keyword `unicast` to view information related only to ipv6 unicast routes.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Added the ipv4 multicast and ipv6 unicast parameters.
9.4(0.0)	Added support for VRF.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.

**Usage Information**

To determine a BGP session flap, both a route-down event and a subsequent route-up event corresponding to a single route are considered. As a result, a flap event is penalized only one time during the route-down event. The subsequent route-up event corresponding to the same route is not considered as a flap and is not penalized.

The history paths that the `show ip bgp` command displays contain only the prefix and the next-hop information. The next-hop information shows the ip address of the neighbor. It does not show the actual next-hop details.

The following describes the `show ip bgp damp` command shown in the following example.

Field	Description
<b>Network</b>	Displays the network ID to which the route is dampened.
<b>From</b>	Displays the IP address of the neighbor advertising the dampened route.
<b>Reuse</b>	Displays the hour:minutes:seconds until the dampened route is available.

Field	Description
Path	Lists all the ASs the dampened route passed through to reach the destination network.

### Example

```
Dell#show ip bgp dampened-paths
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.5
Status codes: s suppressed, S stale, d dampened, h history, *
valid, > best
Path source: I - internal, a - aggregate, c - confed-external,
r - redistributed
              n - network, D - denied, S - stale

## BGP Extended Communities (RFC 4360)

BGP Extended Communities, as defined in RFC 4360, is an optional transitive BGP attribute.

BGP Extended Communities provides two major advantages over Standard Communities:

- The range is extended from 4-octet (AA:NN) to 8-octet (Type:Value) to provide enough number communities.
- Communities are structured using a new "Type" field (1 or 2-octets), allowing you to provide granular control/filter routing information based on the type of extended communities.

### set extcommunity rt

To set Route Origin community attributes in Route Map, use this feature.

#### S4820T

##### Syntax

```
set extcommunity rt {as4 ASN4:NN [non-trans] | ASN:NNNN [non-trans] | IPADDR:NN [non-trans]} [additive]
```

To delete the Route Origin community, use the `no set extcommunity` command.

##### Parameters

<b>as4 ASN4:NN</b>	Enter the keyword <code>as4</code> then the 4-octet AS specific extended community number in the format ASN4:NN (4-byte AS number:2-byte community value).
<b>ASN:NNNN</b>	Enter the 2-octet AS specific extended community number in the format ASN:NNNN (2-byte AS number:4-byte community value).

<b><i>IPADDR:NN</i></b>	Enter the IP address specific extended community in the format <code>IPADDR:NN</code> (4-byte IPv4 Unicast Address:2-byte community value).
<b><i>additive</i></b>	(OPTIONAL) Enter the keyword <code>additive</code> to add to the existing extended community.
<b><i>non-trans</i></b>	(OPTIONAL) Enter the keywords <code>non-trans</code> to indicate a non-transitive BGP extended community.

**Defaults** none

**Command Modes** ROUTE MAP (config-route-map)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

<b>Version 8.3.19.0</b>	Introduced on the S4820T
<b>Version 8.3.11.1</b>	Introduced on the Z-9000.
<b>Version 8.3.7.0</b>	Introduced on the S4810.
<b>Version 7.8.1.0</b>	Introduced on the S-Series.
<b>Version 7.7.1.0</b>	Introduced on the C-Series.
<b>Version 7.6.1.0</b>	Introduced on the E-Series.

**Usage Information** If the `set community rt` and `soo` are in the same route-map entry, the behavior defines as:

- If the `rt` option comes before `soo`, with or without the `additive` option, `soo` overrides the communities `rt` sets.
- If the `rt` option comes after `soo`, without the `additive` option, `rt` overrides the communities `soo` sets.
- If the `rt` with the `additive` option comes after `soo`, `rt` adds the communities `soo` sets.

**Related Commands** [set extcommunity soo](#) — sets the extended community site-of-origin in the route-map.

## set extcommunity soo

To set extended community site-of-origin in Route Map, use this feature.

### S4820T

**Syntax** `set extcommunity soo {as4 ASN4:NN | ASN:NNNN | IPADDR:NN [non-trans]}`

To delete the site-of-origin community, use the `no set extcommunity` command.

## Parameters

<b>as4 ASN4:NN</b>	Enter the keyword <code>as4</code> then the 4-octet AS specific extended community number in the format <code>ASN4:NN</code> (4-byte AS number:2-byte community value).
<b>ASN:NNNN</b>	Enter the 2-octet AS specific extended community number in the format <code>ASN:NNNN</code> (2-byte AS number:4-byte community value).
<b>IPADDR:NN</b>	Enter the IP address specific extended community in the format <code>IPADDR:NN</code> (4-byte IPv4 Unicast Address:2-byte community value).
<b>non-trans</b>	(OPTIONAL) Enter the keywords <code>non-trans</code> to indicate a non-transitive BGP extended community.

## Defaults

none

## Command Modes

ROUTE MAP (config-route-map)

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

<b>Version 8.3.19.0</b>	Introduced on the S4820T.
<b>Version 8.3.11.1</b>	Introduced on the Z9000.
<b>Version 8.3.7.0</b>	Introduced on the S4810.
<b>Version 7.8.1.0</b>	Introduced on the S-Series.
<b>Version 7.7.1.0</b>	Introduced on the C-Series.
<b>Version 7.6.1.0</b>	Introduced on the E-Series.

## Usage Information

If the set community `rt` and `soo` are in the same route-map entry, the behavior defines as:

- If the `rt` option comes before `soo`, with or without the `additive` option, `soo` overrides the communities `rt` sets.
- If the `rt` option comes after `soo`, without the `additive` option, `rt` overrides the communities `soo` sets.
- If the `rt` with the `additive` option comes after `soo`, `rt` adds the communities `soo` sets.

## Related Commands

[set extcommunity rt](#) — sets the extended community route origins using the route-map.

## show ip bgp ipv4 extcommunity-list

To display the IPv4 routes matching the extended community list name, use this feature.

<b>Syntax</b>	<code>show ip bgp [ipv4 [multicast   unicast]   ipv6 unicast] extcommunity-list name</code>								
<b>Parameters</b>	<table><tr><td><b>multicast</b></td><td>Enter the keyword <code>multicast</code> to display the multicast route information.</td></tr><tr><td><b>unicast</b></td><td>Enter the keyword <code>unicast</code> to display the unicast route information.</td></tr><tr><td><b>ipv6 unicast</b></td><td>Enter the keywords <code>ipv6 unicast</code> to display the IPv6 unicast route information.</td></tr><tr><td><b>name</b></td><td>(OPTIONAL) Enter the name of the extcommunity-list.</td></tr></table>	<b>multicast</b>	Enter the keyword <code>multicast</code> to display the multicast route information.	<b>unicast</b>	Enter the keyword <code>unicast</code> to display the unicast route information.	<b>ipv6 unicast</b>	Enter the keywords <code>ipv6 unicast</code> to display the IPv6 unicast route information.	<b>name</b>	(OPTIONAL) Enter the name of the extcommunity-list.
<b>multicast</b>	Enter the keyword <code>multicast</code> to display the multicast route information.								
<b>unicast</b>	Enter the keyword <code>unicast</code> to display the unicast route information.								
<b>ipv6 unicast</b>	Enter the keywords <code>ipv6 unicast</code> to display the IPv6 unicast route information.								
<b>name</b>	(OPTIONAL) Enter the name of the extcommunity-list.								
<b>Defaults</b>	none								
<b>Command Modes</b>	<ul style="list-style-type: none"><li>EXEC</li><li>EXEC Privilege</li></ul>								
<b>Command History</b>	<p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> <table><tr><td><b>Version 9.0.2.0</b></td><td>Introduced on the S6000.</td></tr><tr><td><b>Version 7.8.1.0</b></td><td>Introduced on the S-Series.</td></tr><tr><td><b>Version 7.7.1.0</b></td><td>Introduced on the C-Series.</td></tr><tr><td><b>Version 7.6.1.0</b></td><td>Introduced on the E-Series.</td></tr></table>	<b>Version 9.0.2.0</b>	Introduced on the S6000.	<b>Version 7.8.1.0</b>	Introduced on the S-Series.	<b>Version 7.7.1.0</b>	Introduced on the C-Series.	<b>Version 7.6.1.0</b>	Introduced on the E-Series.
<b>Version 9.0.2.0</b>	Introduced on the S6000.								
<b>Version 7.8.1.0</b>	Introduced on the S-Series.								
<b>Version 7.7.1.0</b>	Introduced on the C-Series.								
<b>Version 7.6.1.0</b>	Introduced on the E-Series.								
<b>Usage Information</b>	<p>If there is a type or sub-type that is not well-known, it is displayed as:TTSS:XX:YYYY.</p> <p>Where TT is type, SS is sub-type displayed in hexadecimal format, XX:YYYY is the value divided into 2-byte and 4-byte values in decimal format. This format is consistent with other vendors.</p> <p>For example, if the extended community has type 0x04, sub-type 0x05, value 0x20 00 00 00 10 00, it displays as:0x0405:8192:4096.</p> <p>Non-transitive extended communities are marked with an asterisk.</p>								

## Example

```
Dell#show ip bgp ipv4 multicast extcommunity-list
BGP routing table entry for 192.168.1.0/24, version 2

Dell#
```

## show ip bgp paths extcommunity

To display all BGP paths having extended community attributes, use this feature.

### S4820T

**Syntax** `show ip bgp paths extcommunity`

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

**Version 9.0.2.0** Introduced on the S6000.

**Version 8.3.19.0** Introduced on the S4820T.

**Version 8.3.7.0** Introduced on the S4810.

**Version 7.8.1.0** Introduced on the S-Series.

**Version 7.7.1.0** Introduced on the C-Series.

**Version 7.6.1.0** Introduced on the E-Series.

### Usage Information

The following describes the `show ip bgp paths extcommunity` command shown in the following example.

Field	Description
Address	Displays the internal address where the path attribute is stored.
Hash	Displays the hash bucket where the path attribute is stored.
Refcount	Displays the number of BGP routes using these extended communities.
Community	Displays the extended community attributes in this BGP path.

#### Example

```
Dell#show ip bgp paths extcommunity
Total 1 Extended Communities

Address      Hash  Refcount  Extended Community
0x41d57024  12272  1          RT:7:200 SoO:5:300 SoO:0.0.0.3:1285

Dell#
```

## show ip extcommunity-list

Display the IP extended community list.

### S4820T

#### Syntax

```
show ip extcommunity-list [word]
```

#### Parameters

**word** Enter the name of the extended community list you want to view.

#### Command Modes

- EXEC
- EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

<b>Version 8.3.19.0</b>	Introduced on the S4820T.
<b>Version 8.3.7.0</b>	Introduced on the S4810.
<b>Version 7.8.1.0</b>	Introduced on the S-Series.
<b>Version 7.7.1.0</b>	Introduced on the C-Series.
<b>Version 7.6.1.0</b>	Introduced on the E-Series.

#### Example

```
Dell#show ip extcommunity-list test
ip extcommunity-list test
```

```

deny RT:1234:12
permit regexp 123
deny regexp 234
deny regexp 123
Dell#

```

## IPv6 BGP Commands

IPv6 border gateway protocol (IPv6 BGP) is supported on the S4820T platform.

BGP is an external gateway protocol that transmits interdomain routing information within and between Autonomous Systems (AS). Basically, two routers (called neighbors or peers) exchange information including full routing tables and periodically send messages to update those routing tables.

### clear ip bgp ipv6 unicast soft

Clear and reapply policies for IPv6 unicast routes without resetting the TCP connection; that is, perform BGP soft reconfiguration.

#### S4820T

##### Syntax

```

clear ip bgp { * | as-number | ipv4-neighbor-addr | ipv6-neighbor-addr | peer-group name } ipv6 unicast soft [in | out]

```

##### Parameters

<b>*</b>	Clear and reapply policies for all BGP sessions.
<b>as-number</b>	Clear and reapply policies for all neighbors belonging to the AS. The range is from 0 to 65535 (2 Byte), from 1 to 4294967295 (4 Byte), or from 0.1 to 0.65535.65535 (Dotted format).
<b>ipv4-neighbor-addr   ipv6-neighbor-addr</b>	Clear and reapply policies for a neighbor.
<b>peer-group name</b>	Clear and reapply policies for all BGP routers in the specified peer group.
<b>ipv6 unicast</b>	Clear and reapply policies for all IPv6 unicast routes.
<b>in</b>	Reapply only inbound policies.
	 <b>NOTE:</b> If you enter <code>soft</code> , without an <code>in</code> or <code>out</code> option, both inbound and outbound policies are reset.
<b>out</b>	Reapply only outbound policies.
	 <b>NOTE:</b> If you enter <code>soft</code> , without an <code>in</code> or <code>out</code> option, both inbound and outbound policies are reset.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.4.1.0	Added support for IPv4 multicast and IPv6 unicast routes.
7.8.1.0	Introduced on the S4810.
7.7.1.0	Introduced on the C-Series.
7.2.1.0	Introduced on the E-Series TeraScale.

## debug ip bgp ipv6 unicast soft-reconfiguration

Enable soft-reconfiguration debugging for IPv6 unicast routes.

### S4820T

**Syntax** `debug ip bgp [ipv4-address | ipv6-address | peer-group-name] ipv6 unicast soft-reconfiguration`

To disable debugging, use the `no debug ip bgp [ipv4-address | ipv6-address | peer-group-name] ipv6 unicast soft-reconfiguration` command.

**Parameters**

<code>ipv4-address</code>   <code>ipv6-address</code>	Enter the IP address of the neighbor on which you want to enable soft-reconfiguration debugging.
<code>peer-group-name</code>	Enter the name of the peer group on which you want to enable soft-reconfiguration debugging.
<code>ipv6 unicast</code>	Debug soft reconfiguration for IPv6 unicast routes.

**Defaults** Disabled.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.

Version	Description
8.4.1.0	Added support for IPv4 multicast and IPv6 unicast routes.
7.8.1.0	Introduced on the S4810.
7.7.1.0	Introduced on the C-Series.
7.2.1.0	Introduced on the E-Series TeraScale.

#### Usage Information

This command turns on BGP soft-reconfiguration inbound debugging for IPv6 unicast routes. If no neighbor is specified, debug is turned on for all neighbors.

## ipv6 prefix-list

Configure an IPv6 prefix list.

### S4820T

#### Syntax

```
ipv6 prefix-list prefix-list name
```

#### Parameters

***prefix-list name*** Enter the name of the prefix list.

**NOTE:** There is a 140-character limit for prefix list names.

#### Defaults

none

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *FTOS Command Line Reference Guide*.

The following is a list of the FTOS version history for this command.

Version	Description
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.10.0	Introduced on the S4810.

## neighbor soft-reconfiguration inbound

Enable a BGP soft-reconfiguration and start storing updates for inbound IPv6 unicast routes.

### S4820T

#### Syntax

```
neighbor {ipv4-address | ipv6-address | peer-group-name} soft-reconfiguration inbound
```

<b>Parameters</b>	<i>ipv4-address</i>   <i>ipv6-address</i>	Enter the IP address of the neighbor for which you want to start storing inbound routing updates.
	<i>peer-group-name</i>	Enter the name of the peer group for which you want to start storing inbound routing updates.

**Defaults** Disabled.

**Command Modes** ROUTER BGPv6 ADDRESS FAMILY (conf-router\_bgpv6\_af)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.4.1.0	Added support for IPv4 multicast and IPv4 unicast address families.
8.3.19.0	Introduced on the S4820T.
7.8.1.0	Introduced on the S4810.
7.7.1.0	Introduced on the C-Series.
7.4.1.0	Introduced

**Usage Information** This command enables soft-reconfiguration for the specified BGP neighbor. BGP stores all updates for inbound IPv6 unicast routes the neighbor receives but does not reset the peer-session.

**CAUTION: Inbound update storage is a memory-intensive operation. The entire BGP update database from the neighbor is stored in memory regardless of the inbound policy results applied on the neighbor.**

## IPv6 MBGP Commands

Multiprotocol BGP (MBGP) is an enhanced BGP that enables the multicast routing policy throughout the internet and connecting multicast topologies between BGP and autonomous systems (AS). FTOS MBGP is implemented as per IETF RFC 1858.

## show ipv6 mbgproutes

Display the selected IPv6 MBGP route or a summary of all MBGP routes in the table.

### S4820T

<b>Syntax</b>	<code>show ipv6 mbgproutes <i>ipv6-address prefix-length</i>   summary</code>	
<b>Parameters</b>	<b><i>ipv6-address</i></b>	(OPTIONAL) Enter the IPv6 address in the x:x:x:x format then the prefix length in the /x format. The range is from /0 to /128.
	<b><i>prefix-length</i></b>	
		<b>NOTE:</b> The :: notation specifies successive hexadecimal fields of zeros.
	<b>summary</b>	Display a summary of RPF routes.
<b>Command Modes</b>	EXEC	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>FTOS Command Line Reference Guide</i> .	

The following is a list of the FTOS version history for this command.

Version	Description
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.10.0	Introduced on the S4810.

# Content Addressable Memory (CAM)

Content addressable memory (CAM) commands are supported on the Dell Networking S4820T platform.

 **NOTE:** Not all CAM commands are supported on all platforms. Be sure to note the platform when looking for a command.

 **WARNING:** If you are using these features for the first time, contact Dell Networking Technical Assistance Center (TAC) for guidance.

## CAM Profile Commands

The CAM profiling feature allows you to partition the CAM to best suit your application. For example:

- Configure more Layer 2 forwarding information base (FIB) entries when the system is deployed as a switch.
- Configure more Layer 3 FIB entries when the system is deployed as a router.
- Configure more access control lists (ACLs) (when IPv6 is not employed).
- Hash multi-protocol label switching (MPLS) packets based on source and destination IP addresses for link aggregation groups (LAGs).
- Hash based on bidirectional flow for LAGs.
- Optimize the virtual local area network (VLAN) ACL Group feature, which permits group VLANs for IP egress ACLs.

## Important Points to Remember

- Dell Networking OS supports CAM allocations on the C-Series and S-Series.
- All line cards within a single system must have the same CAM profile (including CAM sub-region configurations); this profile must match the system CAM profile (the profile on the primary route processor module [RPM]).
- Dell Networking OS automatically reconfigures the CAM profile on line cards and the secondary RPM to match the system CAM profile by saving the correct profile on the card and then rebooting it.
- The CAM configuration is applied to the entire system when you use the CONFIGURATION mode commands. Save the running-configuration to affect the change.
- When budgeting your CAM allocations for ACLs and quality of service (QoS) configurations, remember that ACL and QoS rules might consume more than one CAM entry depending on complexity. For example, transmission control protocol (TCP) and user datagram protocol (UDP) rules with `port range` options might require more than one CAM entry.
- After you install a secondary RPM, copy the running-configuration to the startup-configuration so that the new RPM has the correct CAM profile.
- You MUST save your changes and reboot the system for CAM profiling or allocations to take effect.

## cam-acl (Configuration)

Select the default CAM allocation settings or reconfigure a new CAM allocation for Layer 2, IPv4, and IPv6 ACLs, Layer 2 and Layer 3 (IPv4) QoS, Layer 2 Protocol Tunneling (L2PT), IP and MAC source address validation for DHCP, Ethernet Connectivity Fault Management (CFM) ACLs, OpenFlow, and Policy-based Routing (PBR).

### S4820T

#### Syntax

```
cam-acl {default | l2acl number ipv4acl number ipv6acl number
ipv4qos number l2qos number l2pt number ipmacacl number [vman-
qos | vman-dual-qos number] ecfmacl number [nlbclusteracl
number] ipv4pbr number }openflow number | fcoe number}
[iscsiptacl number] [vrfv4acl number]
```

#### Parameters

<b>default</b>	Use the default CAM profile settings and set the CAM as follows: <ul style="list-style-type: none"><li>• L2Acl : 6</li><li>• IPV4Acl : 4</li><li>• IPV6Acl : 0</li><li>• IPV4Qos : 2</li><li>• L2Qos : 1</li><li>• L2PT : 0</li><li>• IpMacAcl : 0</li><li>• VmanQos : 0</li><li>• VmanDualQos : 0</li><li>• EcfmAcl : 0</li><li>• nlbclusteracl : 0</li><li>• FcoeAcl : 0</li><li>• iscsiOptAcl : 0</li><li>• ipv4pbr : 0</li><li>• vrfv4Acl : 0</li><li>• Openflow : 0</li><li>• fedgovacl : 0</li></ul>
<b>l2acl <i>number</i></b>	Enter the keyword <i>l2acl</i> and then the number of l2acl blocks. The range is from 1 to 8.
<b>ipv4acl <i>number</i></b>	Enter the keyword <i>ipv4acl</i> and then the number of FP blocks for IPv4. The range is from 0 to 8.
<b>ipv6acl <i>number</i></b>	Enter the keyword <i>ipv6acl</i> and then the number of FP blocks for IPv6. The range is from 0 to 4.
<b>ipv4qos <i>number</i></b>	Enter the keyword <i>ipv4qos</i> and then the number of FP blocks for IPv4. The range is from 0 to 8.

<b>l2qos number</b>	Enter the keyword <code>l2qos</code> and then the number of FP blocks for l2 qos. The range is from 1 to 8.
<b>l2pt number</b>	Enter the keyword <code>l2pt</code> and then the number of FP blocks for l2 protocol tunnelling. The range is from 0 to 1.
<b>lpmacacl number</b>	Enter the keyword <code>lpmacacl</code> and then the number of FP blocks for IP and MAC ACL. The range is from 0 to 6.
<b>ecfmaccl number</b>	Enter the keyword <code>ecfmaccl</code> and then the number of FP blocks for ECFM ACL. The range is from 0 to 5.
<b>nlbclusteracl number</b>	Enter the keyword <code>nlbclusteracl</code> and then the number of FP blocks for nlbcluster ACL. The range is from 0 to 2. By default the value is 0 and it supports 8 NLB arp entries reserved for internal functionality.

**NOTE:** When you reconfigure CAM allocation, use the `nlbclusteracl number` command to change the number of NLB ARP entries. The range is from 0 to 2. The default value is 0. At the default value of 0, eight NLB ARP entries are available for use. This platform supports up to 512 CAM entries. Select 1 to configure 256 entries. Select 2 to configure 512 entries. Even though you can perform CAM carving to allocate the maximum number of NLB entries, Dell Networking recommends that you use a maximum of 64 NLB ARP entries.

<b>vman-qos  vman-dual-qos number</b>	Enter the keyword <code>evman-qos</code> and then the number of FP blocks for VMAN QoS. The range is from 0 to 6.
<b>vman-dual-qos number</b>	Enter the keyword <code>vman-dual-qos</code> and then the number of FP blocks for VMAN dual QoS. The range is from 0 to 4.
<b>ipv4pbr number</b>	Enter the keyword <code>ipv4pbr</code> and then the number of FP blocks for ipv4pbr ACL. The range is from 0 to 8.
<b>Openflow number</b>	Enter the keyword <code>openflow</code> and then the number of FP blocks for open flow (multiples of 4). The range is from 0 to 8.
<b>fcoeacl number</b>	Enter the keyword <code>fcoeacl</code> and then the number of FP blocks for FCOE ACL. The range is from 0 to 6.
<b>iscsioptacl number</b>	Enter the keyword <code>iscsioptacl</code> and then the number of FP blocks for iSCSI optimization ACL. The range is from 0 to 2.
<b>vrfv4acl number</b>	Enter the keyword <code>vrfv4acl</code> and then the number of FP blocks for VRF IPv4 ACL. The range is from 0 to 2.

**l2acl number**  
**ipv4acl number**  
**ipv6acl**  
**number,**  
**ipv4qos**  
**number l2qos**  
**number l2pt**  
**number**  
**ipmacacl**  
**number**  
**ecfmacl**  
**number**  
**{nlbclusteracl}**  
**[vman-qos |**  
**vman-dual-qos**  
**number]**  
**ipv4pbr**  
**numberopenflo**  
**w {4|8} | fcoe**  
**number**  
**[iscsiptacl**  
**number]**  
**[vrfv4acl**  
**number]**

Allocate space to each CAM region.

Enter 4 or 8 for the number of OpenFlow FP blocks.

- 4: Creates 242 entries for use by the OpenFlow controller (256 total entries minus the 14 entries reserved for internal functionality)
- 8: Creates 498 entries for use by the OpenFlow controller (512 total entries minus the 14 entries reserved for internal functionality)

The fcoe range is 0–6 groups. Each group has 128 entries; the value given must be an even number. This information is stored in the NVRAM and is effective after rebooting the switch.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Added the <code>nlbcluster ACL</code> keyword. Introduced on the S6000-ON.
9.4(0.0)	Added support for PBR and VRF.
9.2(0.2)	Added support for fcoe.
9.1(0.0)	Added support for OpenFlow.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.10.2	Clarified block information for the S4810.
8.3.10.0	Introduced on the S4810.
8.3.1.0	Added the keywords <code>ecfmacl</code> , <code>vman-qos</code> , and <code>vman-dual-qos</code> .

Version	Description
8.2.1.0	Introduced on the S-Series.
7.8.1.0	Introduced on the C-Series.

### Usage Information

Save the new CAM settings to the startup-config (`write-mem` or `copy run start`) then reload the system for the new settings to take effect.

The total amount of space allowed is 16 FP Blocks. System flow requires three blocks; these blocks cannot be reallocated. Only 13 number of blocks can be configured by the user .

There can be only one odd number of Blocks in the CLI configuration; the other Blocks must be in factors of 2. For example, a CLI configuration of 5+4+2+1+1 Blocks is not supported; a configuration of 6+4+2+1 Blocks is supported.

The `ipv6acl` allocation must be a factor of 2.

If allocation values are not entered for the CAM regions, the value is 0.

If you enable BMP, to perform a reload on the chassis to upgrade any configuration changes that have changed the NVRAM content, use the command `reload conditional nvram-cfg-change`.

## cam-acl-egress

Allocate CAM for egress ACLs.

### S4820T

**Syntax** `cam-acl-egress default | l2acl number ipv4acl number ipv6acl number`

**Parameters**

<b><i>default</i></b>	Reset egress CAM ACL entries to default settings.
<b><i>l2acl number</i></b>	Allocate space to each CAM region. The total space allocated must equal 4. The <code>ipv6acl</code> range must be a factor of 2.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant Dell Networking OS Command Line Reference Guide.

The following is a list of the Dell Networking OS version history for this command..

Version	Description
9.7(0.0)	Introduced on the S6000-ON.

Version	Description
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.

## cam-optimization

Optimize CAM utilization for QoS Entries by minimizing require policy-map CAM space.

### S4820T

<b>Syntax</b>	<code>cam-optimization [qos]</code>		
<b>Parameters</b>	<table> <tr> <td><b>qos</b></td> <td>Optimize CAM usage for QoS.</td> </tr> </table>	<b>qos</b>	Optimize CAM usage for QoS.
<b>qos</b>	Optimize CAM usage for QoS.		
<b>Defaults</b>	Disabled.		
<b>Command Modes</b>	CONFIGURATION		
<b>Command History</b>	<p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p>		

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the S-Series.
7.8.1.0	Introduced on the C-Series.

<b>Usage Information</b>	<p>When you enable this command, if a Policy Map containing classification rules (ACL and/or dscp/ ip-precedence rules) is applied to more than one physical interface on the same port pipe, only a single copy of the policy is written (only one FP entry is used).</p>
--------------------------	--

**NOTE:** An ACL itself may still require more that a single FP entry, regardless of the number of interfaces. For more information, refer to the “IP Access Control Lists”, “Prefix Lists”, and “Route-map” sections in the *Dell Networking OS Configuration Guide*.

## show cam-acl

Display the details of the CAM profiles on the chassis and all stack units.

### S4820T

**Syntax** show cam-acl

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the C-Series.

**Usage Information** The display reflects the settings implemented with the `cam-acl` command.

### Example

```
Dell#show cam-acl

-- Chassis Cam ACL --
      Current Settings(in block sizes)
      1 block = 128 entries
L2Acl      :      6
Ipv4Acl    :      4
Ipv6Acl    :      0
Ipv4Qos    :      2
L2Qos      :      1

FcoeAcl    :      0
iscsiOptAcl :      0
ipv4pbr    :      0
vrfv4Acl   :      0
Openflow   :      0
fedgovacl  :      0
nlbclusteracl:      0

```

## test cam-usage

Verify that enough CAM space is available for the IPv6 ACLs you have created.

### S4820T

**Syntax** `test cam-usage service-policy input input policy name stack-unit {number | all}`

#### Parameters

<b><i>policy-map name</i></b>	Enter the name of the policy-map to verify. Maximum is 32 characters.
<b><i>number</i></b>	Enter <code>all</code> to get information for all the linecards/stack-units or enter the linecard/ stack-unit number to get information for a specific card. The range is 0-7 for all other S-Series.

<b>Defaults</b>	none
<b>Command Modes</b>	EXEC Privilege
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .

The following is a list of the Dell Networking OS version history for this command.

Version	Description
<b>9.7(0.0)</b>	Introduced on the S6000–ON.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>7.8.1.0</b>	Introduced.

<b>Usage Information</b>	This command applies to both IPv4 and IPv6 CAM Profiles, but is best used when verifying QoS optimization for IPv6 ACLs.
--------------------------	--

QoS Optimization for IPv6 ACLs does not impact the CAM usage for applying a policy on a single (or the first of several) interfaces. It is most useful when a policy is applied across multiple interfaces; it can reduce the impact to CAM usage across subsequent interfaces.

The following describes the `test cam-usage` command shown in the following example.

Term	Explanation
<b>Stack-Unit</b>	Lists the stack unit or units that are checked. Entering <code>all</code> shows the status for all stacks.
<b>Portpipe</b>	Lists the portpipe (port-set) or port pipes (port-sets) that are checked. Entering <code>all</code> shows the status for linecards or stack units and port-pipes in the chassis. The port set value is from 0 to 0.
<b>CAM Partition</b>	Shows the CAM profile of the CAM.
<b>Available CAM</b>	Identifies the amount of CAM space remaining for that profile.
<b>Estimated CAM per Port</b>	Estimates the amount of CAM space the listed policy will require.
<b>Status</b>	Indicates whether or not the policy will be allowed in the CAM.

**Example (S-Series)**

```
Dell#test cam-usage service-policy input In stack-unit all
Stack-Unit | Portpipe | CAM Partition | Available CAM |
Estimated CAM per Port| Status
-----
0 | 0 | IPv4Flow | 102 | 0| Allowed
0 | 0 | IPv4Flow | 102 | 0| Allowed
Dell#
!
Dell#test cam-usage service-policy input In stack-unit 0 port-
set 0
Stack-Unit | Portpipe | CAM Partition | Available CAM |
Estimated CAM per Port| Status
-----
0 | 0 | IPv4Flow | 102 | 0| Allowed
Dell#
```

**Usage Information**

The following describes the test cam-usage command shown in the Example below.

Term	Explanation
<b>Stack-Unit</b>	Lists the stack unit or units that are checked. Entering all shows the status for all stacks.
<b>Portpipe</b>	Lists the portpipe (port-set) or port pipes (port-sets) that are checked. Entering all shows the status for linecards and port-pipes in the chassis.
<b>CAM Partition</b>	Shows the CAM profile of the CAM.
<b>Available CAM</b>	Identifies the amount of CAM space remaining for that profile.
<b>Estimated CAM per Port</b>	Estimates the amount of CAM space the listed policy will require.
<b>Status</b>	Indicates whether or not the policy will be allowed in the CAM.

**Example (S-Series)**

```
Dell#test cam-usage service-policy input LauraIn stack-unit all
Stack-Unit|Portpipe|CAM Partition|AvailableCAM|EstimatedCAM
per Port|Status
-----
0| 0| IPv4Flow|
102| 0| Allowed
0| 0| IPv4Flow|
102| 0| Allowed
Dell#
!
Dell#test cam-usage service-policy input LauraIn stack-unit 0
port-set 1
Stack-Unit|Portpipe|CAM Partition|Available CAM|EstimatedCAM
per Port|Status
-----
```

```
102|      0|      0|      IPv4Flow|
Dell#      0|Allowed
```

# Control Plane Policing (CoPP)

The CoPP commands are supported on the Dell Networking S4820T platform.

## control-plane-cpuqos

To manage control-plane traffic, enter control-plane mode and configure the switch.

### S4820T

<b>Syntax</b>	<code>control-plane-cpuqos</code>
<b>Defaults</b>	Not configured.
<b>Command Modes</b>	CONFIGURATION
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.8.0	Introduced on the S4810.

## ip unknown-unicast

Enable IPv4 catch-all route.

### S4820T

<b>Syntax</b>	<code>ip unknown-unicast [vrf vrf-name]</code> To remove the IPv4 catch-all route (0.0.0.0/0) from the LPM route forwarding table in hardware which gets added as a default configuration after the initialization of FIB Agent module, use the <code>no ip unknown-unicast</code> command.						
<b>Defaults</b>	None						
<b>Parameters</b>	<b>vrf vrf-name</b> (Optional) Enter the keyword <code>vrf</code> followed by the name of the VRF to enable catch-all routes corresponding to that VRF.						
<b>Command Modes</b>	CONFIGURATION						
<b>Command History</b>	<table><thead><tr><th>Version</th><th>Description</th></tr></thead><tbody><tr><td>9.7(0.0)</td><td>Introduced on the S6000-ON.</td></tr><tr><td>9.4(0.0)</td><td>Introduced on the S-Series.</td></tr></tbody></table>	Version	Description	9.7(0.0)	Introduced on the S6000-ON.	9.4(0.0)	Introduced on the S-Series.
Version	Description						
9.7(0.0)	Introduced on the S6000-ON.						
9.4(0.0)	Introduced on the S-Series.						
<b>Usage Information</b>	Use this command to add the IPv4 catch-all route (0.0.0.0/0) in the LPM route forwarding table if it was deleted using the <code>no ip unknown-unicast</code> command previously. This will be the default configuration after reload.						

## ipv6 unknown-unicast

Disable soft forwarding of unknown IPv6 destination packets.

### S4820T

<b>Syntax</b>	<code>[no] ipv6 unknown-unicast</code>				
<b>Defaults</b>	Soft forwarding is enabled.				
<b>Command Modes</b>	CONFIGURATION				
<b>Command History</b>	<table><thead><tr><th>Version</th><th>Description</th></tr></thead><tbody><tr><td>9.7(0.0)</td><td>Introduced on the S6000-ON.</td></tr></tbody></table>	Version	Description	9.7(0.0)	Introduced on the S6000-ON.
Version	Description				
9.7(0.0)	Introduced on the S6000-ON.				

Version	Description
9.4(0.0)	Introduced on the S4810, S4820T, S6000, and Z9000.

**Usage Information** All the default catch-all entries in the longest prefix match (LPM) table collect and transmit all unresolved IPv6 packets to the CPU, even if they are destined for unknown destinations.

## service-policy rate-limit-cpu-queues

Apply a policy map for the system to rate limit control traffic on a per-queue basis.

### S4820T

**Syntax** `service-policy rate-limit-cpu-queues policy-name`

**Parameters**

*policy-name* Enter the service-policy name, using a string up to 32 characters.

**Defaults** Not configured.

**Command Modes** CONTROL-PLANE-CPUQOS

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.8.0	Introduced on the S4810.

**Usage Information** Create a policy-map by associating a queue number with the qos-policy.

Create QoS policies prior to enabling this command.

For CoPP, use the keyword `cpu-qos` when creating qos-policy-input.

**Related Commands** [qos-policy-input](#) — creates a QoS input policy map.

[policy-map-input](#) — creates an input policy map.

## service-policy rate-limit-protocols

Apply a policy for the system to rate limit control protocols on a per-protocol basis.

### S4820T

<b>Syntax</b>	<code>service-policy rate-limit-protocols <i>policy-name</i></code>
<b>Parameters</b>	<b><i>policy-name</i></b> Enter the service-policy name, using a string up to 32 characters.
<b>Defaults</b>	Not configured.
<b>Command Modes</b>	CONTROL-PLANE-CPUQOS
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.8.0	Introduced on the S4810.

**Usage Information** This command applies the service-policy based on the type of protocol defined in the ACL rules.

Create ACL and QoS policies prior to enabling this command.

For CoPP, use the keyword `cpu-qos` when creating `qos-policy-input`.

#### Related Commands

[ip access-list extended](#) — creates an extended IP ACL.

[mac access-list extended](#) — creates an extended MAC ACL.

[qos-policy-input](#) — creates a QoS input policy map.

[class-map](#) — creates a QoS class map.

[policy-map-input](#) — creates an input policy map.

## show cpu-queue rate cp

Display the rates for each CPU queue.

### S4820T

**Syntax** show cpu-queue rate cp

**Defaults** Not configured.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.8.0	Introduced on the S4810.

**Usage Information** This command applies the service-policy based on the type of protocol defined in the ACL rules.

Create ACL and QoS policies prior to enabling this command.

### Example

```
Dell#show cpu-queue rate cp
Service-Queue      Rate (PPS)      Burst ( )
-----
Q0                  1300             512
Q1                   300              50
Q2                   300              50
Q3                   400              50
Q4                  2000             50
Q5                   300              50
Q6                   400              50
Q7                   400              50
Q8                   400              50
Q9                   600              50
```

Q10	300	50
Q11	300	50

## show ip protocol-queue-mapping

Display the queue mapping for each configured protocol.

### S4820T

**Syntax** show ip protocol-queue-mapping

**Defaults** Not configured.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.8.0	Introduced on the S4810.

### Example

```
Dell#show ip protocol-queue-mapping
  Protocol  Src-Port  Dst-Port  TcpFlag  Queue  EgPort
  Rate (kbps)
  -----  -
TCP (BGP)   any/179   179/any   _        Q9

## show ipv6 protocol-queue-mapping

Display the queue mapping for each configured IPv6 protocol.

### S4820T

**Syntax** `show ipv6 protocol-queue-mapping`

**Defaults** Not configured.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.8.0	Introduced on the S4810.

### Example

```

Dell#show ipv6 protocol-queue-mapping
  Protocol  Src-Port  Dst-Port  TcpFlag  Queue  EgPort
  Rate (kbps)
  -----  -
  -----  -
TCP (BGP)   any/179   179/any   -        Q9

## Data Center Bridging (DCB)

Data center bridging (DCB) refers to a set of IEEE Ethernet enhancements that provide data centers with a single, robust, converged network to support multiple traffic types, including local area network (LAN), server, and storage traffic.

The Dell Networking operating software commands for data center bridging features include 802.1Qbb priority-based flow control (PFC), 802.1Qaz enhanced transmission selection (ETS), and the data center bridging exchange (DCBX) protocol.

This chapter includes the following sections:

- [DCB Command](#)
- [PFC Commands](#)

### DCB Command

The following DCB command is supported on the Dell Networking OS.

#### dcb-enable

Enable data center bridging.

**Syntax** `dcb enable [pfc-queues 1|4]`

To disable DCB, use the `no dcb enable` command.

**Parameters** *pfc-queues* Enter the pfc-queue range. To disable DCB, use the `no dcb enable` command. The range is from 1 or 2.

**Defaults** None

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

Version

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.

#### Usage Information

By default, iSCSI is enabled on the unit and the flow control is enabled on all of the interfaces. It is also acts as defaults when the link-level flow control is enabled on one or more interfaces.

Enables priority flow control or enhance transmission selection on interface.

#### Related Commands

[dcb <ets | pfc> enable](#) — enable priority flow control or enhanced transmission selection on interface.

## PFC Commands

The following PFC commands are supported on the Dell Networking OS.

### clear pfc counters

Clear the PFC TLV counters and PFC statistics on an interface or stack unit.

**Syntax** `clear pfc counters [port-type slot/port[] | stack-unit {unit number | all } all stack-ports all]}`

#### Parameters

<b>port-type</b>	Enter the keywords <code>port-type</code> then the slot/port information.
<b>stack-unit <i>unit number</i></b>	Enter the keywords <code>stack-unit</code> then the stack-unit number to be cleared.
<b>all stack-ports all</b>	Enter the keywords <code>all stack-ports all</code> to clear the counters on all interfaces.
<b>statistics</b>	Enter the keyboard <code>statistics</code> to clear the hardware PFC counters.

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.

**Usage Information** If you do not use the `statistics` parameter, both hardware and DCBx counters clear.

## description

Enter a text description of the DCB policy (PFC input or ETS output).

**Syntax** `description text`  
To remove the text description, use the `no description` command.

**Parameters** **text** Enter the description of the output policy. The maximum is 32 characters.

**Defaults** none

**Command Modes**

- DCB INPUT POLICY
- DCB OUTPUT POLICY

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.

## pfc mode on

Enable the PFC configuration on the port so that the priorities are included in DCBX negotiation with peer PFC devices.

### Syntax

`pfc mode on`

To disable the PFC configuration, use the `no pfc mode on` command.

### Defaults

PFC mode is on.

### Command Modes

DCB INPUT POLICY

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.

### Usage Information

**NOTE:** Please note that Dell Networking does not recommend to use this command as it has been deprecated in the current 9.4.(0.0) release. A warning message appears when you try to run this command indicating that you have to use the dcb-map commands in the future.

By applying a DCB input policy with PFC enabled, you enable PFC operation on ingress port traffic. To achieve complete lossless handling of traffic, also enable PFC on all DCB egress ports or configure the dot1p priority-queue assignment of PFC priorities to lossless queues (refer to `pfc no-drop queues`).

To disable PFC operation on an interface, enter the `no pfc mode on` command in DCB Input Policy Configuration mode. PFC is enabled and disabled as global DCB operation is enabled (`dcb-enable`) or disabled (`no dcb-enable`).

You cannot enable PFC and link-level flow control at the same time on an interface.

## pfc no-drop queues

Configure the port queues that still function as no-drop queues for lossless traffic.

**Syntax** `pfc no-drop queues queue-range`  
To remove the no-drop port queues, use the `no pfc no-drop queues` command.

**Parameters** **queue-range** Enter the queue range. Separate the queue values with a comma; specify a priority range with a dash; for example, `pfc no-drop queues 1,3` or `pfc no-drop queues 7` or `pfc no-drop queues 0,7`. The range is from 0 to 3.

**Defaults** No lossless queues are configured.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.

### Usage Information

- When you configure lossless queues on an interface, PFC priority configuration is not allowed on the dcb-input profile applied on the interface.
- The maximum number of lossless queues globally supported on the switch is two.

The following lists the dot1p priority-queue assignments.

dot1p Value in the Incoming Frame	Description heading
0	0
1	0
2	0
3	1

dot1p Value in the Incoming Frame	Description heading
4	2
5	3
6	3
7	3

## show dcb

Displays the data center bridging status, the number of PFC-enabled ports, and the number of PFC-enabled queues.

**Syntax** `show dcb [stack-unit unit-number] [port-set port-set-number]`

**Parameters**

*unit-number* Enter the DCB unit number.

*port-set-number* Enter the port-set number.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.

**Usage Information** Specify a stack-unit number on the Master switch in a stack.

**Example**

```
Dell# show dcb
stack-unit 1 port-set 0
      DCB Status : Enabled
      PFC Port Count : 56 (current), 56 (configured)
      PFC Queue Count : 2 (current), 2 (configured)
```

## show interface pfc

Displays the PFC configuration applied to ingress traffic on an interface, including priorities and link delay.

**Syntax** `show interface port-type slot/port[] pfc {summary | detail}`

**Parameters**

<b>port-type slot/ port[] pfc</b>	Enter the port-type slot and port PFC information.
<b>{summary   detail}</b>	Enter the keyword <code>summary</code> for a summary list of results or enter the keyword <code>detail</code> for a full list of results.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.2.(0.0)	Down status messages added.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.

**Usage Information** To clear the PFC TLV counters, use the `clear pfc counters interface port-type slot/port[]` command.

The following describes the `show interface pfc summary` command shown in the following example.

Field	Description
<b>Interface</b>	Interface type with stack-unit and port number.
<b>Admin mode is on Admin is enabled</b>	PFC admin mode is on or off with a list of the configured PFC priorities. When the PFC admin mode is on, PFC advertisements are enabled to be sent and received from peers; received PFC configuration take effect. The admin operational status for a DCBX exchange of PFC configuration is enabled or disabled.
<b>Remote is enabled, Priority list Remote Willing Status is enabled</b>	Operational status (enabled or disabled) of peer device for DCBX exchange of PFC configuration with a list of the configured PFC priorities. Willing status of peer device for DCBX exchange (Willing bit received in PFC TLV): enabled or disable.

Field	Description
<b>Local is enabled</b>	DCBX operational status (enabled or disabled) with a list of the configured PFC priorities.
<b>Operational status (local port)</b>	Port state for current operational PFC configuration: <ul style="list-style-type: none"> <li>• <code>Init</code>: Local PFC configuration parameters were exchanged with the peer.</li> <li>• <code>Recommend</code>: Remote PFC configuration parameters were received from the peer.</li> <li>• <code>Internally propagated</code>: PFC configuration parameters were received from the configuration source.</li> </ul>
<b>PFC DCBX Oper status</b>	Operational status for the exchange of the PFC configuration on the local port: match (up) or mismatch (down).
<b>State Machine Type</b>	Type of state machine used for DCBX exchanges of the PFC parameters: Feature — for legacy DCBX versions; Symmetric — for an IEEE version.
<b>TLV Tx Status</b>	Status of the PFC TLV advertisements: enabled or disabled.
<b>PFC Link Delay</b>	Link delay (in quanta) used to pause specified priority traffic.
<b>Application Priority TLV: FCOE TLV Tx Status</b>	Status of FCoE advertisements in application priority TLVs from the local DCBX port: enabled or disabled.
<b>Application Priority TLV: SCSI TLV Tx Status</b>	Status of iSCSI advertisements in application priority TLVs from the local DCBX port: enabled or disabled.
<b>Application Priority TLV: Local FCOE Priority Map</b>	Priority bitmap the local DCBX port uses in FCoE advertisements in application priority TLVs.
<b>Application Priority TLV: Local SCSI Priority Map</b>	Priority bitmap the local DCBX port uses in iSCSI advertisements in application priority TLVs.
<b>Application Priority TLV: Remote FCOE Priority Map</b>	Status of FCoE advertisements in application priority TLVs from the remote peer port: enabled or disabled.
<b>Application Priority TLV: Remote SCSI Priority Map</b>	Status of iSCSI advertisements in application priority TLVs from the remote peer port: enabled or disabled.
<b>PFC TLV Statistics: Input TLV pkts</b>	Number of PFC TLVs received.

Field	Description
PFC TLV Statistics: Output TLV pkts	Number of PFC TLVs transmitted.
PFC TLV Statistics: Error pkts	Number of PFC error packets received.
PFC TLV Statistics: Pause Tx pkts	Number of PFC pause frames transmitted.
PFC TLV Statistics: Pause Rx pkts	Number of PFC pause frames received.

**Example  
(Summary)**

```

Dell# show interfaces tengigabitethernet 1/4 pfc summary
Interface TenGigabitEthernet 1/4
  Admin mode is on
  Admin is enabled
  Remote is enabled, Priority list is 4
  Remote Willing Status is enabled
  Local is enabled
  Oper status is Recommended
  PFC DCBX Oper status is Up
  State Machine Type is Feature
  TLV Tx Status is enabled
  PFC Link Delay 45556 pause quantams
  Application Priority TLV Parameters :
-----
  FCOE TLV Tx Status is disabled
  ISCSI TLV Tx Status is disabled
  Local FCOE PriorityMap is 0x8
  Local ISCSI PriorityMap is 0x10
  Remote FCOE PriorityMap is 0x8
  Remote ISCSI PriorityMap is 0x8

Dell# show interfaces tengigabitethernet 1/4 pfc detail

  0 Input TLV pkts, 1 Output TLV pkts, 0 Error pkts,
  0 Pause Tx pkts, 0 Pause Rx pkts

```

## show interface pfc statistics

Displays counters for the PFC frames received and transmitted (by dot1p priority class) on an interface.

**Syntax** `show interface port-type slot/port[] pfc statistics`

**Parameters**

<i>port-type</i>	Enter the port type.
<i>slot/port</i> []	Enter the slot/port number.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.

### Example (Summary)

```
Dell#show int te 1/1 pfc statistics
Interface TenGigabitEthernet 1/1
Priority          Rx XOFF Frames          Rx Total
Frames          Tx Total Frames
-----
-
0                0                0
0                0                0
1                0                0
0                0                0
2                0                0
0                0                0
3                0                0
0                0                0
4                0                0
0                0                0
5                0                0
0                0                0
6                0                0
0                0                0
7                0                0
0                0                0
```

## show stack-unit stack-ports pfc details

Displays the PFC configuration applied to ingress traffic on stacked ports, including PFC Operational mode on each unit with the configured priorities, link delay, and number of pause packets sent and received.

**Syntax** `show stack-unit {all | stack-unit} stack-ports {all | port-number} pfc details`

**Parameters**

<b><i>stack-unit</i></b>	Enter the stack unit.
<b><i>port-number</i></b>	Enter the port number.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.

**Example (Summary)** Dell(conf)# show stack-unit all stack-ports all pfc details

```
stack unit 0 stack-port all
  Admin mode is On
  Admin is enabled, Priority list is 4-5
  Local is enabled, Priority list is 4-5
  Link Delay 45556 pause quantum
  0 Pause Tx pkts, 0 Pause Rx pkts

stack unit 1 stack-port all
  Admin mode is On
  Admin is enabled, Priority list is 4-5
  Local is enabled, Priority list is 4-5
  Link Delay 45556 pause quantum
  0 Pause Tx pkts, 0 Pause Rx pkts
```

## ETS Commands

The following ETS commands are supported on the Dell Networking OS.

## bandwidth-percentage

Configure the bandwidth percentage allocated to priority traffic in port queues.

<b>Syntax</b>	<code>bandwidth-percentage percentage</code> To remove the configured bandwidth percentage, use the <code>no bandwidth-percentage</code> command.
<b>Parameters</b>	<b>percentage</b> (Optional) Enter the bandwidth percentage. The percentage range is from 1 to 100% in units of 1%.
<b>Defaults</b>	none
<b>Command Modes</b>	QOS-POLICY-OUT-ETS
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.

**Usage Information**  
By default, equal bandwidth is assigned to each port queue and each dot1p priority in a priority group. To configure bandwidth amounts in associated dot1p queues, use the `bandwidth-percentage` command. When specified bandwidth is assigned to some port queues and not to others, the remaining bandwidth (100% minus assigned bandwidth amount) is equally distributed to unassigned non-strict priority queues in the priority group. The sum of the allocated bandwidth to all queues in a priority group must be 100% of the bandwidth on the link.

ETS-assigned bandwidth allocation applies only to data queues, not to control queues.

The configuration of bandwidth allocation and strict-queue scheduling is not supported at the same time for a priority group. If you configure both, the configured bandwidth allocation is ignored for priority-group traffic when you apply the output policy on an interface.

By default, equal bandwidth is assigned to each priority group in the ETS output policy applied to an egress port if you did not configure bandwidth allocation. The

sum of configured bandwidth allocation to dot1p priority traffic in all ETS priority groups must be 100%. Allocate at least 1% of the total bandwidth to each priority group and queue. If bandwidth is assigned to some priority groups but not to others, the remaining bandwidth (100% minus assigned bandwidth amount) is equally distributed to nonstrict-priority groups which have no configured scheduler.

**Related  
Commands**

- [qos-policy-output ets](#) — creates a QoS output policy.
- [scheduler](#) — schedules priority traffic in port queues.

## clear ets counters

Clear all ETS TLV counters on an interface.

<b>Syntax</b>	<code>clear ets counters port-type slot/port[]</code>
<b>Parameters</b>	<b>port-type</b> Enter the keywords <code>port-type</code> then the slot/port information.
<b>Defaults</b>	none
<b>Command Modes</b>	EXEC Privilege
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.

## dcb-enable

Enable data center bridging.

<b>Syntax</b>	<code>dcb enable [pfc-queues 1 4]</code> To disable DCB, use the <code>no dcb enable</code> command.
---------------	---

<b>Parameters</b>	<b><i>pfc-queues</i></b>	Enter the pfc-queue range. To disable DCB, use the no dcb enable command. The range is from 1 or 2.												
<b>Defaults</b>	None													
<b>Command Modes</b>	CONFIGURATION

<b>Related Commands</b>	<p><a href="#">dcb &lt;ets   pfc&gt; enable</a> — enable priority flow control or enhanced transmission selection on interface.</p>													

## description

Enter a text description of the DCB policy (PFC input or ETS output).

**Syntax** `description text`  
 To remove the text description, use the no `description` command.

**Parameters**

**text** Enter the description of the output policy. The maximum is 32 characters.

**Defaults** none

**Command Modes**

- DCB INPUT POLICY
- DCB OUTPUT POLICY

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.

## priority-list

Configure the 802.1p priorities for the traffic on which you want to apply an ETS output policy.

### Syntax

`priority-list value`

To remove the priority list, use the `no priority-list` command.

### Parameters

**value** Enter the priority list value. Separate priority values with a comma; specify a priority range with a dash; for example, `priority-list 3,5-7`. The range is from 0 to 7.

### Defaults

none

### Command Modes

PRIORITY-GROUP

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.

## Usage Information

By default:

- All 802.1p priorities are grouped in priority group 0.
- 100% of the port bandwidth is assigned to priority group 0. The complete bandwidth is equally assigned to each priority class so that each class has 12 to 13%.

## priority-group

To use with an ETS output policy, create an ETS priority group.

### Syntax

```
priority-group group-name
```

To remove the priority group, use the `no priority-group` command.

### Parameters

***group-name***

Enter the name of the ETS priority group. The maximum is 32 characters.

### Defaults

none

### Command Modes

CONFIGURATION

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

**Version  
8.3.19.0**

Introduced on the S4820T.

**Version  
8.3.12.0**

Introduced on the S4810.

**Version  
8.3.16.0**

Introduced on the MXL 10/40GbE Switch IO Module.

### Usage Information

**NOTE:** Please note that Dell Networking does not recommend to use this command as it has been deprecated in the current 9.4.(0.0) release. A warning message appears when you try to run this command indicating that you have to use the `dcb-map` commands in the future.

A priority group consists of 802.1p priority values that are grouped for similar bandwidth allocation and scheduling, and that share latency and loss requirements. All 802.1p priorities mapped to the same queue must be in the same priority group.

You must configure 802.1p priorities in priority groups associated with an ETS output policy. You can assign each dot1p priority to only one priority group.

The maximum number of priority groups supported in ETS output policies on an interface is equal to the number of data queues (4) on the port. The 802.1p priorities in a priority group can map to multiple queues.

If you configure more than one priority queue as strict priority or more than one priority group as strict priority, the higher numbered priority queue is given preference when scheduling data traffic.

You must fully define the priority-group profile with a PGID and priorities before mapping it to a QoS policy because the PGID and priorities are unique keys of the traffic class group (TCG) that define the QoS policy.

You must disable the DCB output policy before changing the PGID or priorities of a priority group assigned to that DCB output policy.

#### Related Commands

- [priority-list](#) — configures the 802.1p priorities for an ETS output policy.
- [set-pgid](#) — configures the priority-group.

## qos-policy-output ets

To configure the ETS bandwidth allocation and scheduling for priority traffic, create a QoS output policy.

#### Syntax

```
qos-policy-output policy-name ets
```

To remove the QoS output policy, use the `no qos-policy-output ets` command.

#### Parameters

***policy-name*** Enter the policy name. The maximum is 32 characters.

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

**Version** Introduced on the S4820T.  
**8.3.19.0**

**Version** Introduced on the S4810.  
**8.3.12.0**

**Version** Introduced on the MXL 10/40GbE Switch IO Module.  
**8.3.16.0**

#### Usage Information

If an error occurs in an ETS output-policy configuration, the configuration is ignored and the scheduler and bandwidth allocation settings are reset to the ETS default values (all priorities are in the same ETS priority group and bandwidth is allocated equally to each priority).

If an error occurs when a port receives a peer's ETS configuration, the port's configuration is reset to the previously configured ETS output policy. If no ETS output policy was previously applied, the port is reset to the default ETS parameters.

You can only associate output QoS policy profiles with the priority groups in the DCB output profile context; output QoS policy profiles are not permitted on output policy-maps.

WRED, ECN, rate shaping, and rate limiting are not supported in output policies because DCBx does not negotiate these parameters with peer devices. You can apply a QoS output policy with WRED and/or rate shaping on a DCBx CIN-enabled interface.

If you enable the `scheduler` command for a QoS ETS output policy, no bandwidth percentage is assigned to the policy.

#### Related Commands

- [scheduler](#) — schedules the priority traffic in port queues.
- [bandwidth-percentage](#) — bandwidth percentage allocated to the priority traffic in port queues.

## set-pgid

Configure the priority-group identifier.

**Syntax** `set-pgid value`

To remove the priority group, use the `no set-pgid` command.

#### Parameters

**value** Enter the priority group identification. The range is from 0 to 7.

**Defaults** none

**Command Modes** PRIORITY-GROUP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

and S4048–

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.

#### Usage Information

**NOTE:** Please note that Dell Networking does not recommended to use this command as it has been deprecated in the current 9.4.(0.0) release. A warning message appears when you try to run this command indicating that you have to use the `dcb-map` commands in the future.

## Related Commands

- [priority-list](#) – configures the 802.1p priorities.

## scheduler

Configure the method used to schedule priority traffic in port queues.

### Syntax

`scheduler value`

To remove the configured priority schedule, use the `no scheduler` command.

### Parameters

**value**

Enter schedule priority value. The range: strict: strict-priority traffic is serviced before any other queued traffic.

### Defaults

Weighted Elastic Round Robin (WERR) scheduling is used to queue priority traffic.

### Command Modes

POLICY-MAP-OUT-ETS

### Command History

This guide is platform-specific. For command information about other platforms and S4048–, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.

### Usage Information

dot1p priority traffic on the switch is scheduled to the current queue mapping. dot1p priorities within the same queue must have the same traffic properties and scheduling method.

ETS-assigned scheduling applies only to data queues, not to control queues.

The configuration of bandwidth allocation and strict-queue scheduling is not supported at the same time for a priority group. If you configure both, the configured bandwidth allocation is ignored for priority-group traffic when you apply the output policy on an interface.

If you enable this command for a QoS ETS output policy, no bandwidth percentage is assigned to the policy.

## Related Commands

- [qos-policy-output ets](#) – configures the ETS bandwidth allocation.

- [bandwidth-percentage](#) — bandwidth percentage allocated to priority traffic in port queues.

## show interface ets

Displays the ETS configuration applied to egress traffic on an interface, including priority groups with priorities and bandwidth allocation.

<b>Syntax</b>	<code>show interface <i>port-type slot/port[]</i> ets {summary   detail}</code>	
<b>Parameters</b>	<b><i>port-type slot/ port[]</i> ets</b>	Enter the port-type slot and port ETS information.
	<b>{summary   detail}</b>	Enter the keyword <code>summary</code> for a summary list of results or enter the keyword <code>detail</code> for a full list of results.
<b>Command Modes</b>	EXEC Privilege	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .	

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.2(0.2)	Down status messages added.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.

## show qos priority-groups

Displays the ETS priority groups configured on the switch, including the 802.1p priority classes and ID of each group.

**Syntax** `show qos priority-groups`

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.

**Example (Summary)**

```

Del#show qos priority-groups
priority-group ipc
priority-list 4
set-pgid 2

```

## show stack-unit stack-ports ets details

Displays the ETS configuration applied to egress traffic on stacked ports, including ETS Operational mode on each unit and the configured priority groups with dot1p priorities, bandwidth allocation, and scheduler type.

**Syntax** `show stack-unit {all | stack-unit} stack-ports {all | port-number} ets details`

**Parameters**

**stack-unit** Enter the stack unit identification.  
**port-number** Enter the port number.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

## DCBX Commands

The following DCBX commands are supported on the Dell Networking OS.

### advertise dcbx-app-tlv

Configure DCBX to send iSCSI TLV advertisements.

#### S4820T

<b>Syntax</b>	<code>advertise dcbx-app-tlv iscsi</code> To disable DCBX iSCSI TLV advertisements, use the <code>no advertise dcbx-app-tlv iscsi</code> command.								
<b>Defaults</b>	Enabled								
<b>Command Modes</b>	PROTOCOL LLDP								
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .  The following is a list of the Dell Networking OS version history for this command. <table><thead><tr><th>Version</th><th>Description</th></tr></thead><tbody><tr><td>8.3.19.0</td><td>Introduced on the S4820T.</td></tr><tr><td>8.3.12.0</td><td>Introduced on the S4810.</td></tr><tr><td>8.3.16.0</td><td>Introduced on MXL 10/40GbE Switch IO Module.</td></tr></tbody></table>	Version	Description	8.3.19.0	Introduced on the S4820T.	8.3.12.0	Introduced on the S4810.	8.3.16.0	Introduced on MXL 10/40GbE Switch IO Module.
Version	Description								
8.3.19.0	Introduced on the S4820T.								
8.3.12.0	Introduced on the S4810.								
8.3.16.0	Introduced on MXL 10/40GbE Switch IO Module.								
<b>Usage Information</b>	You can configure iSCSI TLVs to send either globally or on a specified interface. The interface configuration takes priority over global configuration.								

### advertise dcbx-appln-tlv

On a DCBX port with a manual role, configure the application priority TLVs advertised on the interface to DCBX peers.

<b>Syntax</b>	<code>advertise dcbx-appln-tlv {fcoe   iscsi}</code> To remove the application priority TLVs, use the <code>no advertise dcbx-appln-tlv {fcoe   iscsi}</code> command.
---------------	---

<b>Parameters</b>	<b>{fcoe   iscsi}</b>	<p>Enter the application priority TLVs, where:</p> <ul style="list-style-type: none"> <li>• <code>fcoe</code>: enables the advertisement of FCoE in application priority TLVs.</li> <li>• <code>iscsi</code>: enables the advertisement of iSCSI in application priority TLVs.</li> </ul>												
<b>Defaults</b>	Application priority TLVs are enabled to advertise FCoE and iSCSI.													
<b>Command Modes</b>	PROTOCOL LLDP													
<b>Command History</b>	<p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> <table border="0"> <thead> <tr> <th style="text-align: left;">Version</th> <th style="text-align: left;">Description</th> </tr> </thead> <tbody> <tr> <td>9.7(0.0)</td> <td>Introduced on the S6000-ON.</td> </tr> <tr> <td>9.0.2.0</td> <td>Introduced on the S6000.</td> </tr> <tr> <td>8.3.19.0</td> <td>Introduced on the S4820T.</td> </tr> <tr> <td>8.3.12.0</td> <td>Introduced on the S4810.</td> </tr> <tr> <td>8.3.16.0</td> <td>Introduced on the MXL 10/40GbE Switch IO Module.</td> </tr> </tbody> </table>		Version	Description	9.7(0.0)	Introduced on the S6000-ON.	9.0.2.0	Introduced on the S6000.	8.3.19.0	Introduced on the S4820T.	8.3.12.0	Introduced on the S4810.	8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.
Version	Description													
9.7(0.0)	Introduced on the S6000-ON.													
9.0.2.0	Introduced on the S6000.													
8.3.19.0	Introduced on the S4820T.													
8.3.12.0	Introduced on the S4810.													
8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.													
<b>Usage Information</b>	<p>To disable TLV transmission, use the <code>no</code> form of the command; for example, <code>no advertise dcbx-appln-tlv iscsi</code>.</p>													

## advertise dcbx-tlv

On a DCBX port with a manual role, configure the PFC and ETS TLVs advertised to DCBX peers.

<b>Syntax</b>	<pre>advertise dcbx-tlv {ets-conf   ets-reco   pfc} [ets-conf   ets-reco   pfc] [ets-conf   ets-reco   pfc]</pre> <p>To remove the advertised ETS TLVs, use the <code>no advertise dcbx-tlv</code> command.</p>	
<b>Parameters</b>	<b>{ets-conf   ets-reco   pfc}</b>	<p>Enter the PFC and ETS TLVs advertised, where:</p> <ul style="list-style-type: none"> <li>• <code>ets-conf</code>: enables the advertisement of ETS configuration TLVs.</li> <li>• <code>ets-reco</code>: enables the advertisement of ETS recommend TLVs.</li> <li>• <code>pfc</code>: enables the advertisement of PFC TLVs.</li> </ul>
<b>Defaults</b>	All PFC and ETS TLVs are advertised.	

**Command Modes** PROTOCOL LLDP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.

**Usage Information** You can configure the transmission of more than one TLV type at a time; for example: `advertise dcbx-tlv ets-conf ets-reco`.

You can enable ETS recommend TLVs (`ets-reco`) only if you enable ETS configuration TLVs (`ets-conf`). To disable TLV transmission, use the `no` form of the command; for example, `no advertise dcbx-tlv pfc ets-reco`.

DCBX requires that you enable LLDP to advertise DCBX TLVs to peers.

Configure DCBX operation at the INTERFACE level on a switch or globally on the switch. To verify the DCBX configuration on a port, use the `show interface dcbx detail` command.

## dcbx port-role

Configure the DCBX port role the interface uses to exchange DCB information.

**Syntax** `dcbx port-role {config-source | auto-downstream | auto-upstream | manual}`

To remove DCBX port role, use the `no dcbx port-role {config-source | auto-downstream | auto-upstream | manual}` command.

**Parameters**

<code>config-source   auto-downstream   auto-upstream   manual</code>	Enter the DCBX port role, where: <ul style="list-style-type: none"><li><code>config-source</code>: configures the port to serve as the configuration source on the switch.</li><li><code>auto-upstream</code>: configures the port to receive a peer configuration. The configuration source is elected from auto-upstream ports.</li><li><code>auto-downstream</code>: configures the port to accept the internally propagated DCB configuration from a configuration source.</li></ul>
---	--

- `manual`: configures the port to operate only on administer-configured DCB parameters. The port does not accept a DCB configuration received from a peer or a local configuration source.

**Defaults**

**Manual**

**Command Modes**

INTERFACE PROTOCOL LLDP

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.

**Usage Information**

DCBX requires that you enable LLDP to advertise DCBX TLVs to peers.

Configure DCBX operation at the INTERFACE level on a switch or globally on the switch. To verify the DCBX configuration on a port, use the `show interface dcbx detail` command.

**dcbx version**

Configure the DCBX version used on the interface.

**Syntax**

`dcbx version {auto | cee | cin | ieee-v2.5}`

To remove the DCBX version, use the `dcbx version {auto | cee | cin | ieee-v2.5}` command.

**Parameters**

**auto | cee | cin | ieee-v2.5**

Enter the DCBX version type used on the interface, where:

- `auto`: configures the port to operate using the DCBX version received from a peer.
- `cee`: configures the port to use CDD (Intel 1.01).
- `cin`: configures the port to use Cisco-Intel-Nuova (DCBX 1.0).
- `ieee-v2`: configures the port to use IEEE 802.1az (Draft 2.5).

<b>Defaults</b>	<b>Auto</b>												
<b>Command Modes</b>	INTERFACE PROTOCOL LLDP												
<b>Command History</b>	<p>This guide is platform-specific. 8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.												
<b>Usage Information</b>	<p>DCBX requires that you enable LLDP to advertise DCBX TLVs to peers.</p> <p>Configure DCBX operation at the INTERFACE level on a switch or globally on the switch. To verify the DCBX configuration on a port, use the <code>show interface dcbx detail</code> command.</p>												

## debug dcbx

Enable DCBX debugging.

<b>Syntax</b>	<pre>debug dcbx {all   auto-detect-timer   config-exchng   fail   mgmt   resource   sem   tlv}</pre> <p>To disable DCBX debugging, use the <code>no debug dcbx</code> command.</p>
---------------	--

<b>Parameters</b>	<p><b>{all   auto-detect-timer   config-exchng   fail   mgmt   resource   sem   tlv}</b></p> <p>Enter the type of debugging, where:</p> <ul style="list-style-type: none"> <li>• <code>all</code>: enables all DCBX debugging operations.</li> <li>• <code>auto-detect-timer</code>: enables traces for DCBX auto-detect timers.</li> <li>• <code>config-exchng</code>: enables traces for DCBX configuration exchanges.</li> <li>• <code>fail</code>: enables traces for DCBX failures.</li> <li>• <code>mgmt</code>: enables traces for DCBX management frames.</li> <li>• <code>resource</code>: enables traces for DCBX system resource frames.</li> <li>• <code>sem</code>: enables traces for the DCBX state machine.</li> <li>• <code>tlv</code>: enables traces for DCBX TLVs.</li> </ul>
-------------------	---

<b>Defaults</b>	none
<b>Command Modes</b>	EXEC Privilege
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.

## fcoe priority-bits

Configure the FCoE priority advertised for the FCoE protocol in application priority TLVs.

<b>Syntax</b>	<code>fcoe priority-bits <i>priority-bitmap</i></code> To remove the configured FCoE priority, use the <code>no fcoe priority-bits</code> command.
---------------	---

<b>Parameters</b>	<b><i>priority-bitmap</i></b> Enter the priority-bitmap range. The range is from 1 to FF.
-------------------	---

<b>Defaults</b>	0x8
-----------------	-----

<b>Command Modes</b>	PROTOCOL LLDP
----------------------	---------------

<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .
------------------------	--

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.

**Usage Information** This command is available at the global level only.

## iscsi priority-bits

Configure the iSCSI priority advertised for the iSCSI protocol in application priority TLVs.

**Syntax** `iscsi priority-bits priority-bitmap`  
To remove the configured iSCSI priority, use the `no iscsi priority-bits` command.

**Parameters** `priority-bitmap` Enter the priority-bitmap range. The range is from 1 to FF.

**Defaults** 0x10

**Command Modes** PROTOCOL LLDP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.

**Usage Information** This command is available at the global level only.

## show interface dcbx detail

Displays the DCBX configuration on an interface.

**Syntax** `show interface port-type slot/port[] dcbx detail`

**Parameters** `port-type` Enter the port type.  
`slot/port[]` Enter the slot/port number.

**Command Modes** EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.2.(0.0)	Down status messages added.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on the MXL 10/40GbE Switch IO Module.

## Usage Information

To clear DCBX frame counters, use the `clear dcbx counters interface stack-unit/port` command.

The following describes the `show interface dcbx detail` command shown in the following example.

Field	Description
Interface	Interface type with chassis slot and port number.
Port-Role	Configured the DCBX port role: auto-upstream, auto-downstream, config-source, or manual.
DCBX Operational Status	Operational status (enabled or disabled) used to elect a configuration source and internally propagate a DCB configuration. The DCBX operational status is the combination of PFC and ETS operational status.
Configuration Source	Specifies whether the port serves as the DCBX configuration source on the switch: true (yes) or false (no).
Local DCBX Compatibility mode	DCBX version accepted in a DCB configuration as compatible. In auto-upstream mode, a port can only receive a DCBX version supported on the remote peer.
Local DCBX Configured mode	DCBX version configured on the port: CEE, CIN, IEEE v2.5, or Auto (port auto-configures to use the DCBX version received from a peer).
Peer Operating version	DCBX version that the peer uses to exchange DCB parameters.
Local DCBX TLVs Transmitted	Transmission status (enabled or disabled) of advertised DCB TLVs (see TLV code at the top of the show command output).
Local DCBX Status: DCBX	DCBX version advertised in Control TLVs.

Field	Description
<b>Operational Version</b>	
<b>Local DCBX Status: DCBX Max Version Supported</b>	Highest DCBX version supported in Control TLVs.
<b>Local DCBX Status: Sequence Number</b>	Sequence number transmitted in Control TLVs.
<b>Local DCBX Status: Acknowledgment Number</b>	Acknowledgement number transmitted in Control TLVs.
<b>Local DCBX Status: Protocol State</b>	Current operational state of the DCBX protocol: ACK or IN-SYNC.
<b>Peer DCBX Status: DCBX Operational Version</b>	DCBX version advertised in Control TLVs received from the peer device.
<b>Peer DCBX Status: DCBX Max Version Supported</b>	Highest DCBX version supported in Control TLVs received from the peer device.
<b>Peer DCBX Status: Sequence Number</b>	Sequence number transmitted in Control TLVs received from the peer device.
<b>Peer DCBX Status: Acknowledgment Number</b>	Acknowledgement number transmitted in Control TLVs received from the peer device.
<b>Total DCBX Frames transmitted</b>	Number of DCBX frames sent from the local port.
<b>Total DCBX Frames received</b>	Number of DCBX frames received from the remote peer port.
<b>Total DCBX Frame errors</b>	Number of DCBX frames with errors received.
<b>Total DCBX Frames unrecognized</b>	Number of unrecognizable DCBX frames received.

#### Example

```
Dell#show interface tengigabitethernet 0/49 dcbx detail
E-ETS Configuration TLV enabled
  e-ETS Configuration TLV disabled
R-ETS Recommendation TLV enabled
  r-ETS Recommendation TLV disabled
```

```

P-PFC Configuration TLV enabled
  p-PFC Configuration TLV disabled
F-Application priority for FCOE enabled
  f-Application Priority for FCOE disabled
I-Application priority for iSCSI enabled
  i-Application Priority for iSCSI disabled
-----

```

```

Interface TenGigabitEthernet 0/49
  Remote Mac Address 00:00:00:00:00:11
  Port Role is Auto-Upstream
  DCBX Operational Status is Enabled
  Is Configuration Source? TRUE

```

```

Local DCBX Compatibility mode is CEE
  Local DCBX Configured mode is CEE
  Peer Operating version is CEE
  Local DCBX TLVs Transmitted: ErPfi

```

```

Local DCBX Status
-----

```

```

  DCBX Operational Version is 0
  DCBX Max Version Supported is 0
  Sequence Number: 2
  Acknowledgment Number: 2
  Protocol State: In-Sync

```

```

Peer DCBX Status:
-----

```

```

  DCBX Operational Version is 0
  DCBX Max Version Supported is 255
  Sequence Number: 2
  Acknowledgment Number: 2
  Total DCBX Frames transmitted 27
  Total DCBX Frames received 6
  Total DCBX Frame errors 0
  Total DCBX Frames unrecognized 0

```

## dcb-map

Create a DCB map to configure priority flow control (PFC) and enhanced transmission selection (ETS) on Ethernet ports that support converged Ethernet traffic. Apply the DCB map to an Ethernet interface.

<b>Syntax</b>	<code>dcb-map <i>map-name</i></code>
<b>Parameters</b>	<p><b><i>map-name</i></b>      Enter a DCB map name. The maximum number of alphanumeric characters is 32.</p>
<b>Defaults</b>	None. There are no pre-configured PFC and ETS settings on S5000 Ethernet interfaces.

**Command Modes** CONFIGURATION  
INTERFACE

<b>Command History</b>	<b>Version</b>	<b>Description</b>
	<b>9.7(0.0)</b>	Introduced on the S6000-ON.
	<b>9.3(0.0)</b>	Introduced on the S4810 and S6000 platforms.

**Usage Information** A DCB map is a template used to configure DCB parameters and apply them on converged Ethernet interfaces. DCB parameters include priority-based flow control (PFC) and enhanced traffic selection (ETS).

To display the PFC and ETS settings in DCB maps, enter the `show qos dcb-map` command.

Use the `dcb-map` command to create a DCB map to specify PFC and ETS settings and apply it on Ethernet ports. After you apply a DCB map to an interface, the PFC and ETS settings in the map are applied when the Ethernet port is enabled. DCBx is enabled on Ethernet ports by default.

The `dcb-map` command is supported only on physical Ethernet interfaces.

To remove a DCB map from an interface, enter the `no dcb-map map-name` command in Interface configuration mode.

## priority-pgid

Assign 802.1p priority traffic to a priority group in a DCB map.

**Syntax** `priority-pgid dot1p0_group-num dot1p1_group-num dot1p2_group-num dot1p3_group-num dot1p4_group-num dot1p5_group-num dot1p6_group-num dot1p7_group-num`

**Parameters**

<code>dot1p0_group-num</code>	Enter the priority group number for each 802.1p class of traffic in a DCB map.
<code>dot1p1_group-num</code>	
<code>dot1p2_group-num</code>	

*dot1p3\_group-  
num*

*dot1p4\_group-  
num*

*dot1p5\_group-  
num*

*dot1p6\_group-  
num*

*dot1p7\_group-  
num*

**Defaults** None

**Command Modes** DCB MAP

**Command History**

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.3(0.0)	Introduced on the S4810, S6000 platforms.

**Usage Information**

PFC and ETS settings are not pre-configured on Ethernet ports. You must use the `dcb-map` command to configure different groups of 802.1p priorities with PFC and ETS settings.

Using the `priority-pgid` command, you assign each 802.1p priority to one priority group. A priority group consists of 802.1p priority values that are grouped together for similar bandwidth allocation and scheduling, and that share latency and loss requirements. All 802.1p priorities mapped to the same queue must be in the same priority group. For example, the `priority-pgid 0 0 0 1 2 4 4 4` command creates the following groups of 802.1p priority traffic:

- Priority group 0 contains traffic with dot1p priorities 0, 1, and 2.
- Priority group 1 contains traffic with dot1p priority 3.
- Priority group 2 contains traffic with dot1p priority 4.
- Priority group 4 contains traffic with dot1p priority 5, 6, and 7.

To remove a `priority-pgid` configuration from a DCB map, enter the `no priority-pgid` command.

## pfc mode on

Enable the PFC configuration on the port so that the priorities are included in DCBX negotiation with peer PFC devices.

<b>Syntax</b>	<code>pfc mode on</code> To disable the PFC configuration, use the <code>no pfc mode on</code> command.						
<b>Defaults</b>	PFC mode is on.						
<b>Command Modes</b>	DCB MAP						
<b>Command History</b>	<table><thead><tr><th>Version</th><th>Description</th></tr></thead><tbody><tr><td>9.7(0.0)</td><td>Introduced on the S6000-ON.</td></tr><tr><td>9.3(0.0)</td><td>Introduced on the MXL 10/40GbE Switch with the FC Flex IO module.</td></tr></tbody></table>	Version	Description	9.7(0.0)	Introduced on the S6000-ON.	9.3(0.0)	Introduced on the MXL 10/40GbE Switch with the FC Flex IO module.
Version	Description						
9.7(0.0)	Introduced on the S6000-ON.						
9.3(0.0)	Introduced on the MXL 10/40GbE Switch with the FC Flex IO module.						
<b>Usage Information</b>	<p>By applying a DCB input policy with PFC enabled, you enable PFC operation on ingress port traffic. To achieve complete lossless handling of traffic, also enable PFC on all DCB egress ports or configure the dot1p priority-queue assignment of PFC priorities to lossless queues (refer to <code>pfc no-drop queues</code>).</p> <p>To disable PFC operation on an interface, enter the <code>no pfc mode on</code> command in DCB Input Policy Configuration mode. PFC is enabled and disabled as global DCB operation is enabled (<code>dcb-enable</code>) or disabled (<code>no dcb-enable</code>).</p> <p>You cannot enable PFC and link-level flow control at the same time on an interface.</p> <p> <b>NOTE:</b> Please note that Dell Networking does not recommended to use this command as it has been deprecated in the current 9.4(0.0) release. A warning message appears when you try to run this command indicating that you have to use the <code>dcb-map</code> commands in the future.</p>						

# priority-group bandwidth pfc

Configure the ETS bandwidth allocation and PFC mode used to manage port traffic in an 802.1p priority group.

## Parameters

<b>priority-group group-num</b>	Enter the keyword <code>priority-group</code> followed by the number of an 802.1p priority group. Use the <code>priority-pgid</code> command to create the priority groups in a DCB map.
<b>bandwidth percentage</b>	Enter the keyword <code>bandwidth</code> followed by a bandwidth percentage allocated to the priority group. The range of valid values is 1 to 100. The sum of all allocated bandwidth percentages in priority groups in a DCB map must be 100%.
<b>strict-priority</b>	Configure the priority-group traffic to be handled with strict priority scheduling. Strict-priority traffic is serviced first, before bandwidth allocated to other priority groups is made available.
<b>pfc (on   off)</b>	Configure whether priority-based flow control is enabled (on) or disabled (off) for port traffic in the priority group.

## Defaults

None

## Command Modes

DCB MAP

## Command History

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.3(0.0)	Introduced on the S4810, S6000 platforms.

## Usage Information

Use the `dcb-map` command to configure priority groups with PFC and/or ETS settings and apply them to Ethernet interfaces.

Use the `priority-pgid` command to map 802.1p priorities to a priority group. You can assign each 802.1p priority to only one priority group. A priority group consists of 802.1p priority values that are grouped together for similar bandwidth allocation and scheduling, and that share latency and loss requirements. All 802.1p priorities mapped to the same queue must be in the same priority group.

Repeat the `priority-group bandwidth pfc` command to configure PFC and ETS traffic handling for each priority group in a DCB map.

You can enable PFC on a maximum of two priority queues.

If you configure more than one priority group as strict priority, the higher numbered priority queue is given preference when scheduling data traffic.

If a priority group does not use its allocated bandwidth, the unused bandwidth is made available to other priority groups.

To remove a priority-group configuration in a DCB map, enter the `no priority-group bandwidth pfc` command.

By default, equal bandwidth is assigned to each dot1p priority in a priority group. Use the `bandwidth` parameter to configure the bandwidth percentage assigned to a priority group. The sum of the bandwidth allocated to all priority groups in a DCB map must be 100% of the bandwidth on the link. You must allocate at least 1% of the total port bandwidth to each priority group.

## dcb-map stack-unit all stack-ports all

Apply the specified DCB map on all ports of the switch stack.

<b>Syntax</b>	<code>dcb-map stack-unit all stack-ports all <i>dcb-map-name</i></code> To remove the PFC and ETS settings in a DCB map from all stack units, use the <code>no dcb-map stack-unit all stack-ports all</code> command.	
<b>Parameters</b>	<b><i>dcb-map-name</i></b>	Enter the name of the DCB map.
<b>Defaults</b>	None	
<b>Command Modes</b>	CONFIGURATION	
<b>Command History</b>	<b>Version</b>	<b>Description</b>
	9.7(0.0)	Introduced on the S6000-ON.
	9.3(0.0)	Introduced on the S4810 and S6000 platforms.
<b>Usage Information</b>	The <code>dcb-map stack-unit all stack-ports all</code> command overwrites any previous DCB maps applied to stack ports.	

# show qos dcb-map

Display the DCB parameters configured in a specified DCB map.

**Syntax** `show qos dcb-map map-name`

**Parameters** **map-name** Displays the PFC and ETS parameters configured in the specified map.

**Command Modes**

- EXEC
- EXEC Privilege

Command History	Version	Description
	9.7(0.0)	Introduced on the S6000-ON.
	9.3(0.0)	Introduced on the S4810 and S6000 platforms.
	9.3(0.0)	Introduced on the FC Flex IO module installed in the MXL 10/40GbE Switch.

**Usage Information** Use the `show qos dcb-map` command to display the enhanced transmission selection (ETS) and priority-based flow control (PFC) parameters used to configure server-facing Ethernet ports. S5000 Ethernet ports are DCBx-enabled by default.

The following table describes the `show qos dcb-map` output shown in the example below.

Field	Description
<b>State</b>	Complete: All mandatory DCB parameters are correctly configured. In progress: The DCB map configuration is not complete. Some mandatory parameters are not configured.
<b>PFC Mode</b>	PFC configuration in DCB map: On (enabled) or Off.
<b>PG</b>	Priority group configured in the DCB map.
<b>TSA</b>	Transmission scheduling algorithm used by the priority group: Enhanced Transmission Selection (ETS).
<b>BW</b>	Percentage of bandwidth allocated to the priority group.
<b>PFC</b>	PFC setting for the priority group: On (enabled) or Off.
<b>Priorities</b>	802.1p priorities configured in the priority group.

**Example**

```
Dell# show qos dcb-map dcbmap2
State      :Complete
```

```

PfcMode:ON
-----
PG:0 TSA:ETS BW:50 PFC:OFF
Priorities:0 1 2 4 5 6 7

PG:1 TSA:ETS BW:50 PFC:ON
Priorities:3

```

## dcb pfc-shared-buffer-size

Configure the maximum amount of shared buffer size for PFC packets in kilobytes.

You must configure the shared buffer size to be less than the total PFC buffer size. If the buffer size and DCB buffer threshold settings are applied on one or more ports, a validation is performed to determine whether following condition is satisfied: Shared-pfc-buffer-size <= (Total-pfc-buffer-size - Σpfc priority <> buffer-size on each port, priority).

If the preceding condition is not satisfied by the shared PFC buffer size value, the configuration is not saved and a system logging message is generated stating that the shared buffer size that you attempt to specify cannot be configured because of the existing total buffer space on the system being lower than the shared buffer size. You must either enter a smaller value for the shared buffer size or increase the total buffer size appropriately by using the `dcb pfc-total- buffer-size` command.

<b>Syntax</b>	<code>dcb pfc-shared-buffer-size KB</code>	
<b>Parameters</b>	<b>KB</b>	Enter a number in the range of 0 to 7787.
<b>Default</b>	The default is 1 KB for S6000 platforms.	
<b>Command Modes</b>	CONFIGURATION mode	
<b>Command History</b>	<b>Version</b>	<b>Description</b>
	9.7(0.0)	Introduced on the S6000-ON.
	9.3(0.0)	Introduced on the S4810, S4820T, and S6000 platforms.
<b>Usage Information</b>	<p>Configure the maximum shared buffer available for PFC traffic. You can choose to increase or decrease the shared buffer that is currently allocated in the system by default. You must configure the shared buffer size to be less than the total PFC buffer size. If the buffer size and DCB buffer threshold settings are applied on one or more ports, a validation is performed to determine whether following condition is satisfied: If the preceding condition is not satisfied by the shared PFC buffer size value, the configuration is not saved and a system logging message is generated as follows:</p> <p>Shared-pfc-buffer-size &lt;= (Total-pfc-buffer-size - Σpfc priority &lt;&gt; buffer-size on each port, priority).</p>	

```
Dell(conf)#dcb pfc-shared-buffer-size 2000
```

```
%ERROR: pfc shared buffer size configured cannot accommodate  
existing buffer requirement in the system.
```

**Example** Dell(conf)#dcb pfc-shared-buffer-size 5000

## dcb-buffer-threshold

Configure the profile name for the DCB buffer threshold. This utility is supported on the S4810, S4820T, and S6000 platforms.

### S4820T

**Syntax** dcb buffer-threshold *profile-name*

**Parameters**

<i>profile-name</i>	Enter the name of the profile, which can be a string of up to 32 characters in length.
---------------------	--

**Default** None

**Command Modes** CONFIGURATION mode

**Command History**

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.3(0.0)	Introduced on the S4810, S4820T, and S6000 platforms.

**Usage Information** When you enter the profile name, you enter the DCB buffer threshold configuration mode. You can specify the shared buffer threshold limit, the ingress buffer size, buffer limit for pausing the acceptance of packets, and the buffer offset limit for resuming the acceptance of received packets.

**Example** S4810-YU-MR-Dell(conf)#dcb buffer-threshold test

## priority

Configure the priority for the PFC threshold to be allocated to the buffer space parameters. This utility is supported on the S4820T platforms.

**Syntax** priority *value* buffer-size *size* pause-threshold *threshold-value*  
resume-offset *threshold-value* shared-threshold-weight *size*

## Parameters

<b>priority</b>	Specify the priority of the queue for which the buffer space settings apply
<b>value</b>	Enter a number in the range of 0 to 7 to denote the priority to be allocated to the dynamic buffer control mechanism
<b>buffer-size</b>	Ingress buffer size
<b>size</b>	Size of the ingress buffer in KB. Enter a number in the range of 0 to 7787. The default is 45 KB.
<b>pause-threshold</b>	Buffer limit for pause frames to be sent
<b>threshold-value</b>	Buffer limit at which the port sends the pause to peer in KB. Enter a number in the range of 0 to 7787. The default is 10 KB.
<b>resume-offset</b>	Buffer offset limit for resuming in KB
<b>threshold-value</b>	Buffer offset limit at which the port resumes the peer in KB. Enter a number in the range of 1 to 7787. The default is 10 KB.
<b>shared-threshold-weight</b>	Buffer shared threshold weight
<b>size</b>	Weightage of the priorities on the shared buffer size in the system. Enter a number in the range of 0 to 9. The default shared threshold weight is 10.

## Default

The default size of the ingress buffer is 45 KB. The default buffer limit at which the port sends the pause to peer and recommences the sending of packets to the peer is 10 KB. The default threshold weight of the shared buffer space is 10.

## Command Modes

DCB-BUFFER-THRESHOLD mode

## Command History

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.3(0.0)	Introduced on the S4810, S4820T, and S6000 platforms.

## Usage Information

For each priority, you can specify the shared buffer threshold limit, the ingress buffer size, buffer limit for pausing the acceptance of packets, and the buffer offset limit for resuming the acceptance of received packets. When PFC detects congestion on a queue for a specified priority, it sends a pause frame for the 802.1p priority traffic to the transmitting device.

You can use the `priority` command to set up both the administrative and peer-related PFC priorities. For example, you can configure the intended buffer configuration for all eight priorities. If you configure the number of lossless queues as 4 and if the administrator-configured priorities configured within the DCB input

policy is applied, then the configuration for those priorities are pre-designed. However, if the peer-provided priorities are applied, although a DCB input policy is present, the peer-provided priorities become effective for buffer configuration. This method of configuration provides an easy and flexible technique to accommodate both administratively-configured and peer-configured priorities.

**Example**

```
Dell(conf-dcb-buffer-thr)#priority 0 buffer-size 52 pause-
threshold 16 resume-offset 10 shared-threshold-weight 7
```

## qos-policy-buffer

Create a QoS policy buffer and enter the configuration mode to configure the no-drop queues, ingress buffer size, buffer limit for pausing, and buffer offset limit for resuming. This utility is supported on the S4820T .

**Syntax**

```
qos-policy-buffer queue queue-num pause no-drop queue buffer-
size size pause-threshold threshold-value resume-offset
threshold-value shared-threshold-weight size
```

**Parameters**

<b>policy-name</b>	Name of the QoS policy buffer that is applied to an interface for this setting to be effective in conjunction with the DCB input policy. You can specify the shared buffer threshold limit, the ingress buffer size, buffer limit for pausing the acceptance of packets, and the buffer offset limit for resuming the acceptance of received packets. This method of configuration enables different peer-provided and administrative priorities to be set up because the intended queue is directly configured instead of determining the priority to queue mapping for local and remote parameters.
<b>queue 0 to queue 7</b>	Specify the queue number to which the QoS policy buffer parameters apply
<b>pause</b>	Pause frames to be sent at the specified buffer limit levels and pause packet settings
<b>no-drop</b>	The packets for this queue must not be dropped
<b>value</b>	Enter a number in the range of 0 to 7 to denote the priority to be allocated to the dynamic buffer control mechanism
<b>buffer-size</b>	Ingress buffer size
<b>size</b>	Size of the ingress buffer in KB. Enter a number in the range of 0 to 7787. The default is 45 KB.
<b>pause-threshold</b>	Buffer limit for pause frames to be sent

<b><i>threshold-value</i></b>	Buffer limit at which the port sends the pause to peer in KB. Enter a number in the range of 0 to 7787. The default is 10 KB.
<b>resume-offset</b>	Buffer offset limit for resuming in KB
<b><i>threshold-value</i></b>	Buffer offset limit at which the port resumes the peer in KB. Enter a number in the range of 1 to 7787. The default is 10 KB.
<b>shared-threshold-weight</b>	Buffer shared threshold weight
<b>size</b>	Weightage of the priorities on the shared buffer size in the system. Enter a number in the range of 0 to 9. The default shared threshold weight is 10.

**Default** The default size of the ingress buffer is 45 KB. The default buffer limit at which the port sends the pause to peer and recommences the sending of packets to the peer is 10 KB. The default threshold weight of the shared buffer space is 10.

**Command Modes** DCB-BUFFER-THRESHOLD mode

<b>Command History</b>	<b>Version</b>	<b>Description</b>
	9.7(0.0)	Introduced on the S6000-ON.
	9.3(0.0)	Introduced on the S4810, S4820T, S6000, and MXL platforms.

**Usage Information** You must apply this buffer policy at the interface level for the attributes to be applicable in conjunction with the DCB input policy.

For each QoS policy buffer, you can specify the shared buffer threshold limit, the ingress buffer size, buffer limit for pausing the acceptance of packets, and the buffer offset limit for resuming the acceptance of received packets. When PFC detects congestion on a queue for a specified priority, it sends a pause frame for the 802.1p priority traffic to the transmitting device.

You can use set up both the administrative and peer-related PFC priorities. For example, you can configure the intended buffer configuration for all 8 priorities. If you configure the number of lossless queues as 4 and if the administrator-configured priorities configured within the DCB input policy is applied, then the configuration for those priorities are pre-designed. However, if the peer-provided priorities are applied, although a DCB input policy is present, the peer-provided priorities become effective for buffer configuration. This method of configuration provides an easy and flexible technique to accommodate both administratively-configured and peer-configured priorities.

**Example** `Dell(conf)# qos-policy-buffer test`

```
Dell(conf-qos-policy-buffer)#queue 0 pause no-drop buffer-size
128000 pause-threshold 103360 resume-threshold 83520
```

```
Dell(conf-qos-policy-buffer)# queue 4 pause no-drop buffer-size
128000 pause-threshold 103360 resume-threshold 83520
```

## dcb-policy buffer-threshold (Interface Configuration)

Assign the DCB policy to the DCB buffer threshold profile on interfaces. This setting takes precedence over the global buffer-threshold setting.

<b>Syntax</b>	<code>dcb-policy buffer-threshold <i>profile-name</i></code>	
<b>Parameters</b>	<b>buffer-threshold</b>	Configure the profile name for the DCB buffer threshold
	<b><i>profile-name</i></b>	Enter the name of the profile, which can be a string of up to 32 characters in length.
<b>Default</b>	None	
<b>Command Modes</b>	INTERFACE mode	
<b>Command History</b>	<b>Version</b>	<b>Description</b>
	<b>9.7(0.0)</b>	Introduced on the S6000-ON.
	<b>9.3(0.0)</b>	Introduced on the S4810, S4820T, and S6000 platforms.
<b>Usage Information</b>	You can configure up to a maximum of four lossless (PFC) queues. By configuring four lossless queues, you can configure four different priorities and assign a particular priority to each application that your network is used to process. For example, you can assign a higher priority for time-sensitive applications and a lower priority for other services, such as file transfers. You can configure the amount of buffer space to be allocated for each priority and the pause or resume thresholds for the buffer. This method of configuration enables you to effectively manage and administer the behavior of lossless queues.	
<b>Example</b>	<code>Dell(conf-if-te-1/1)#dcb-policy buffer-threshold test</code>	

## dcb-policy dcb-buffer-threshold (Global Configuration)

Assign the DCB policy to the DCB buffer threshold profile on stack ports that applies globally throughout the system. This utility is supported on the and S4820T platforms. This command is not supported on the S6000 platform because it does not contain stack ports.

<b>Syntax</b>	<code>dcb-policy buffer-threshold <i>stack-unit</i> all stack-ports all <i>profile-name</i></code>	
<b>Parameters</b>	<b>dcb-buffer-threshold</b>	Configure the profile name for the DCB buffer threshold
	<b><i>profile-name</i></b>	Enter the name of the profile, which can be a string of up to 32 characters in length.
	<b>stack-unit all</b>	Enter the stack unit identification. Indicates the specific the stack unit or units. Entering all shows the status for all stacks.
	<b>stack-port all</b>	Enter the port number of a port in a switch stack.
<b>Default</b>	None	
<b>Command Modes</b>	CONFIGURATION mode	
<b>Command History</b>	<b>Version</b>	<b>Description</b>
	9.3(0.0)	Introduced on the S4810 and S4820T platforms.
<b>Usage Information</b>	You can configure up to a maximum of four lossless (PFC) queues. By configuring four lossless queues, you can configure four different priorities and assign a particular priority to each application that your network is used to process. For example, you can assign a higher priority for time-sensitive applications and a lower priority for other services, such as file transfers. You can configure the amount of buffer space to be allocated for each priority and the pause or resume thresholds for the buffer. This method of configuration enables you to effectively manage and administer the behavior of lossless queues.	
<b>Example</b>	<pre>Dell(conf)# dcb-policy buffer-threshold stack-unit all stack-ports all test</pre>	

## show qos dcb-buffer-threshold

Displays the DCB buffer threshold assigned to a QoS policy. This command is supported on the platform.

**Syntax** `show qos dcb buffer-threshold {name}`

**Parameters**                    *name*                    Enter the name of the profile, which can be a string of up to 32 characters in length.

**Command Modes**                EXEC  
EXEC Privilege

**Command History**                **Version**                **Description**  
9.7(0.0)                    Introduced on the S6000-ON.  
9.3(0.0)                    Introduced on the S6000 platform.

**Usage Information**                The following table describes the output fields displayed for the `show` command:

Field	Description
Name	Name of the DCB buffer threshold profile
Buffer threshold parameters	Buffer size allocated for the PFC priority queue and the priority of the queue

**Example**                            Dell#show qos dcb buffer-threshold  
  
Name        :        test1  
Buffer threshold parameters:  
pfc priority 0 buffer-size 40  
pfc priority 3 buffer-size 50

## dcB pfc-total-buffer-size

Configure the total buffer size for PFC in kilobytes. This utility is supported on the S6000 platform.

**Syntax**                            `dcB pfc-total-buffer-size KB`

**Parameters**                        *KB*                        Enter a number in the range of 0 to 7787.

**Default**                            The default is 1 KB for S6000 platforms.

**Command Modes**                    CONFIGURATION mode

<b>Command History</b>	<table border="0"> <thead> <tr> <th style="text-align: left;">Version</th> <th style="text-align: left;">Description</th> </tr> </thead> <tbody> <tr> <td>9.7(0.0)</td> <td>Introduced on the S6000-ON.</td> </tr> <tr> <td>9.3(0.0)</td> <td>Introduced on the S6000 platform.</td> </tr> </tbody> </table>	Version	Description	9.7(0.0)	Introduced on the S6000-ON.	9.3(0.0)	Introduced on the S6000 platform.
Version	Description						
9.7(0.0)	Introduced on the S6000-ON.						
9.3(0.0)	Introduced on the S6000 platform.						
<b>Usage Information</b>	<p>Configure the maximum buffer available for PFC traffic. You can choose to increase or decrease the buffer size that is currently allocated in the system by default. However, if you modify the PFC buffer size to be lower than the previously configured PFC buffer size, the system determines whether this reduction in size is valid without disrupting the existing configuration. In such a scenario, you must disable and re-enable DCB. For example, if you modify the total buffer size to be 4000 KB from the previous size of 5000 KB, an error message is displayed that this reduction cannot be performed owing to existing system configuration because of queues that are being currently processed.</p> <p>The lossless queue limit per port is validated based on the <code>dcb pfc-queues</code> command. PFC queue configuration identifies the maximum number of queues a port can support. Although the queue limit per port is a baseline when dynamic buffering is enabled, the limit per port for queues depends on the availability of the buffer.</p>						
<b>Example</b>	<pre>Dell(conf)#dcb pfc-total-buffer-size 5000  Dell(conf)#dcb pfc-total-buffer-size 4000 %ERROR: Total pfc buffer size configured cannot accommodate existing buffer requirement in the system.</pre>						

## show running-config dcb-buffer-threshold

Displays the DCB buffer threshold details in the running configuration.

<b>Syntax</b>	<code>show running-config buffer-threshold</code>
<b>Command Modes</b>	EXEC EXEC Privilege

<b>Command History</b>	<table border="0"> <thead> <tr> <th style="text-align: left;">Version</th> <th style="text-align: left;">Description</th> </tr> </thead> <tbody> <tr> <td>9.7(0.0)</td> <td>Introduced on the S6000-ON.</td> </tr> <tr> <td>9.3(0.0)</td> <td>Introduced on the S6000 platform.</td> </tr> </tbody> </table>	Version	Description	9.7(0.0)	Introduced on the S6000-ON.	9.3(0.0)	Introduced on the S6000 platform.
Version	Description						
9.7(0.0)	Introduced on the S6000-ON.						
9.3(0.0)	Introduced on the S6000 platform.						

**Usage Information** The following table describes the output fields displayed for the `show running-config dcb-buffer-threshold` command:

Field	Description
Profile name	Name of the DCB buffer threshold profile
Priority	The priority of the queue for which the buffer space settings apply
buffer-size	Ingress buffer size
pause-threshold-value	Buffer limit at which the port sends the pause to peer in KB.
resume-threshold-value	Buffer offset limit at which the port resumes the peer in KB.

### Example

```
Dell#show run buffer-threshold
```

```
!
dcb-buffer-threshold test1
pfc priority 0 buffer-size 40
pfc priority 3 buffer-size 50
!
dcb-buffer-threshold test2
pfc priority 0 buffer-size 80 pause-threshold 50
!
dcb-buffer-threshold test3
pfc priority 0 buffer-size 80 pause-threshold 60 resume-
threshold 30
```

On interface on which PFC is enabled:

```
Show interface tengigabitethernet 1/1 pfc buffer-threshold
```

```
-----
Queue#   Lossless   Buffer-size   Pause-threshold   Resume-
offset   Shared     threshold    (KB)              offset
(KB)     weight
-----
0        No         -            -                 -
-
1        No         -            -                 -
-
2        Yes        -            20                -
-          9
3        Yes        52           25                -
15         0
4        Yes        -            45                -
25         5
5        No         -            -                 -
-
6        No         -            -                 -
-
7        No         -            -                 -
-
-        Denotes dynamic buffering is enabled in respective queues
```

On interface in which PFC is not enabled:

```
Dell#show interface tengigabitethernet 1/20 pfc buffer-
threshold
```

The following table describes the output fields displayed for the `show interface pfc buffer-threshold` command:

Field	Description
queue	Number of the queue
lossless	Whether the queue is a lossy or lossless queue for which buffer threshold is configured
buffer-size	Ingress buffer size
pause-threshold-value	Buffer limit at which the port sends the pause to peer in KB.
resume-threshold-value	Buffer offset limit at which the port resumes the peer in KB.
shared threshold weight	Weightage of the priorities on the shared buffer size in the system.

## dcb pfc-queues

Configure the number of PFC queues. This utility is supported on the and platforms.

<b>Syntax</b>	<code>dcb pfc-queues value</code>	
<b>Parameters</b>	<b>value</b>	Enter the number of PFC queues in the range of 0 through 4. The number of ports supported based on lossless queues configured will depend on the buffer.
<b>Default</b>	The default number of PFC queues in the system is 2 for S4810 and 1 for S6000 platforms.	
<b>Command Modes</b>	CONFIGURATION mode	
<b>Command History</b>	<b>Version</b>	<b>Description</b>
	9.7(0.0)	Introduced on the S6000-ON.
	9.3(0.0)	Introduced on the S4810 and S6000 platforms.
<b>Usage Information</b>	You can configure up to a maximum of four lossless (PFC) queues. By configuring four lossless queues, you can configure four different priorities and assign a particular priority to each application that your network is used to process. For example, you can assign a higher priority for time-sensitive applications and a lower priority for other services, such as file transfers. You can configure the amount of buffer space to be allocated for each priority and the pause or resume	

thresholds for the buffer. This method of configuration enables you to effectively manage and administer the behavior of lossless queues.

**Example** `Dell(conf)#dcb pfc-queues 4`

## dcb {ets | pfc} enable

Enable priority flow control or enhanced transmission selection on interface.

**Syntax** `dcb {ets | pfc} enable`

- To disable ETS on interface, use **"no dcb ets enable"** command.
- To disable PFC on interface, use **"no dcb pfc enable"** command.

**Defaults** Enable

**Command Modes** INTERFACE

**Command History**

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.3 (0.1)	Introduced on S6000, S4810, and S4820T.

**Usage Information**

PFC and ETS are enabled by default on the interfaces when DCB is globally enabled (refer to `dcb enable`). In some network topology, you may want to disable PFC on an interface and apply link level flow control; Similarly you may want to disable ETS on an interface and apply QoS bandwidth configurations.

**Limitations**

- "dcb-map" CLI on interface is mutually exclusive to "no dcb ets enable" and "no dcb pfc enable".
- "pfc priority" CLI is mutually exclusive to "no dcb pfc enable" command.
- Deprecated CLI "dcb-policy input" and "no dcb pfc enable" cannot coexist at interface level.
- Deprecated CLI "dcb-policy output" and "no dcb ets enable" cannot coexist at interface level.

# Debugging and Diagnostics

The basic debugging and diagnostic commands are supported by the Dell Networking Operating System. This chapter contains the following sections:

- Diagnostic and Monitoring Commands
- Offline Diagnostic Commands
- Hardware Commands

## Diagnostics and Monitoring Commands

The following section describes the diagnostics and monitoring commands. For similar commands, refer to the [Control and Monitoring](#) chapter.

### logging coredump stack-unit

Enable coredump on a stack.

**Syntax** `logging coredump stack-unit {stack-unit-number | all}`

**Parameters**

<i>stack-unit</i>	Enter the stack-unit id.
<i>stack-unit-number</i>	
all	Enable coredump on all stack-unit.

**Defaults** Enabled by default on customer builds.

**Command Modes** CONFIGURATION

Command History	Version	Description
	9.7(0.0)	Introduced on the S6000-ON.
	9.0.2.0	Introduced on the S6000.
	8.3.19.0	Introduced on the S4820T.
	8.3.11.1	Introduced on the Z9000.

Version	Description
8.3.7.0	Introduced on the S4810.

**Usage Information**

The Kernel core dump can be large and may take up to 5 to 30 minutes to upload. Dell Networking OS does not overwrite application core dumps so you should delete them as necessary to conserve space on the flash; if the flash is out of memory, the coredump is aborted. On the S-Series, if the FTP server is not reachable, the application coredump is aborted. Dell Networking OS completes the coredump process and wait until the upload is complete before rebooting the system.

## Offline Diagnostic Commands

The offline diagnostics test suite is useful for isolating faults and debugging hardware. While tests are running, Dell Networking OS results are saved as a text file (TestReport-SU-X.txt) in the flash directory. This `show file` command is available only on master and standby.

### Important Points to Remember

- Offline diagnostics can only be run when the unit is offline.
- You can only run offline diagnostics on a unit to which you are connected via the console. In other words, you cannot run diagnostics on a unit to which you are connected to via a stacking link.
- Diagnostic results are printed to the screen. Dell Networking OS does not write them to memory.
- Diagnostics only test connectivity, not the entire data path.

### diag stack-unit

Run offline diagnostics on a stack unit.

**Syntax** `diag stack-unit number [alllevels | level0 | level1 | level2] verbose testname`

**Parameters**

<b><i>number</i></b>	Enter the stack-unit id.  The range is from 0 to 11.
<b><i>alllevels</i></b>	Enter the keyword <code>alllevels</code> to run the complete set of offline diagnostic tests.
<b><i>level0</i></b>	Enter the keyword <code>level0</code> to run Level 0 diagnostics. Level 0 diagnostics check for the presence of various components and perform essential path verifications. In addition, they verify the identification registers of the components on the board.

<b>level1</b>	Enter the keyword <code>level1</code> to run Level 1 diagnostics. Level 1 diagnostics is a smaller set of diagnostic tests with support for automatic partitioning. They perform status/self test for all the components on the board and test their registers for appropriate values. In addition, they perform extensive tests on memory devices (for example, SDRAM, flash, NVRAM, EEPROM, and CPLD) wherever possible. There are no tests on 10G links. At this level, stack ports are shut down automatically.
<b>level2</b>	Enter the keyword <code>level2</code> to run Level 2 diagnostics. Level 2 diagnostics are a full set of diagnostic tests with no support for automatic partitioning. Level 2 diagnostics are used primarily for on-board loopback tests and more extensive component diagnostics. Various components on the board are put into Loopback mode and test packets are transmitted through those components. These diagnostics also perform snake tests using VLAN configurations. To test 10G links, physically remove the unit from the stack.
<b>verbose</b>	Enter the keyword <code>verbose</code> to run the diagnostic in Verbose mode. Verbose mode gives more information in the output than Standard mode.
<b>testname</b>	Enter the keyword <code>testname</code> to run a specific test case. Enclose the test case name in double quotes (" "). For example: <code>diag stack-unit 1 level1 testname "first"</code> . You can use this option only for interactive tests.

**Defaults**

none

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

<b>Version</b>	<b>Description</b>
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.3.1.0</b>	Introduced the <code>verbose</code> option.
<b>7.7.1.0</b>	Introduced on the S-Series.

## offline stack-unit

Place a stack unit in the offline state.

**Syntax** `offline stack-unit number`

**Parameters**

<b><i>number</i></b>	Enter the stack-unit id.
	Range: S4820T — 0 to 11

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Added a warning message to the off-line diagnostic.
7.7.1.0	Introduced on the S-Series.

**Usage Information** You cannot enter this command on a Master or Standby unit.

The system reboots when the off-line diagnostics complete. This reboot is an automatic process. A warning message appears when the `offline stack-unit` command is implemented.

```
Warning - Diagnostic execution will cause stack-unit to reboot after completion of diags.
```

```
Proceed with Offline-Diags [confirm yes/no]:y
```

**Related Commands** [show environment \(S-Series\)](#) — views the S-Series system component status (for example, temperature, voltage).

## online stack-unit

Place a stack unit in the online state.

**Syntax** `online stack-unit number`

**Parameters** ***number*** Enter the stack-unit number. The S4820T range is from 0 to 11.

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.7.1.0	Introduced on the S-Series.

**Usage Information** You cannot enter this command on a Master or Standby unit.

The system reboots when the off-line diagnostics complete. This reboot is an automatic process. A warning message appears when the `offline stack-unit` command is implemented.

Warning - Diagnostic execution will cause stack-unit to reboot after completion of diags.

```
Proceed with Offline-Diags [confirm yes/no]:y
```

**Related Commands** [show environment \(S-Series\)](#) — views the S-Series system component status (for example, temperature, voltage).

# Hardware Commands

These commands display information from a hardware sub-component or ASIC.

## clear hardware stack-unit

Clear statistics from selected hardware components.

**Syntax** `clear hardware stack-unit id {counters | unit 0-0 counters |  
cpu data-plane statistics | cpu i2c statistics | cpu party-bus  
statistics | cpu sata-interface statistics | stack-port 0-127}`

### Parameters

<b>stack-unit <i>id</i></b>	Enter the keywords <code>stack-unit</code> then a number to select a particular stack member and then enter one of the following command options to clear a specific collection of data. The range is from 0 to 11.
<b>counters</b>	Enter the keyword <code>counters</code> to clear the counters on the selected stack member.
<b>unit <i>number</i> counters</b>	Enter the keyword <code>unit</code> along with a port-pipe number, then the keyword <code>counters</code> to clear the counters on the selected port-pipe. The range is from 0 to 0.
<b>cpu data-plane statistics</b>	Enter the keywords <code>cpu data-plane statistics</code> to clear the data plane statistics.
<b>cpu party-bus statistics</b>	Enter the keywords <code>cpu party-bus statistics</code> to clear the management statistics.
<b>stack-port</b>	Enter the keywords <code>stack-port</code> then the port number of the stacking port to clear the statistics of the particular stacking port. The range is from 0 to 63.

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.

Version	Description
8.3.11.0	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.

**Related Commands** [show hardware stack-unit](#) — displays the data plane or management plane input and output statistics of the designated component of the designated stack member.

## clear hardware system-flow

Clear system-flow statistics from selected hardware components.

**Syntax** `clear hardware system-flow layer2 stack-unit number port-set 0-0 counters`

**Parameters**

**stack-unit *number*** Enter the keywords `stack-unit` then a number to select a particular stack member and then enter one of the following command options to clear a specific collection of data. The range is from 0 to 11.

**port-set 0-0 counters** Enter the keywords `port-set` along with a port-pipe number, then the keyword `counters` to clear the system-flow counters on the selected port-pipe. The range is from 0 to 0.

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.0	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.

**Related Commands**      [show hardware stack-unit](#) — displays the data plane or management plane input and output statistics of the designated component of the designated stack member.

## clear hardware vlan-counters

Clear VLAN statistics.

<b>Syntax</b>	<code>clear hardware vlan-counters <i>vlan-id</i></code>	
<b>Parameters</b>	<b><i>vlan-id</i></b>	Enter the interface VLAN number. The range is from 1 to 4094.
<b>Defaults</b>	none	
<b>Command Modes</b>	EXEC Privilege	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .	

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.7(0.0)	Introduced this command.

## hardware watchdog

To trigger a reboot and restart the system, set the watchdog timer.

<b>Syntax</b>	<code>hardware watchdog stack-unit {&lt;0-5&gt;   all}</code>
<b>Defaults</b>	Enabled.
<b>Command Modes</b>	CONFIGURATION
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.

Version	Description
8.3.11.0	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.

**Usage Information**

This command enables a hardware watchdog mechanism that automatically reboots an Dell Networking OS switch/ router with a single unresponsive unit. This behavior is a last-resort mechanism intended to prevent a manual power cycle.

## show hardware layer2

Display Layer 2 ACL or eg data for the selected stack member and stack member port-pipe.

**Syntax** `show hardware layer2 {eg-acl | in-acl} stack-unit id port-set 0-0`

**Parameters**

- eg-acl | in-acl** Enter either the keyword `eg-acl` or the keyword `in-acl` to select between ingress or egress ACL data.
- stack-unit id** Enter the keyword `stack-unit` to select a stack ID. The range is from 0 to 11.
- port-set 0-0** Enter the keywords `port-set` with a port-pipe number. . The range is from 0 to 0.

**Defaults**

none

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.

**Usage Information**

The unit numbers given are internal port numbers.

## show hardware layer3

Display Layer 3 ACL or QoS data for the selected stack member and stack member port-pipe.

**Syntax** `show hardware layer3 {acl | qos} stack-unit number port-set 0-0`

**Parameters**

<b>acl   qos</b>	Enter either the keyword <code>acl</code> or the keyword <code>qos</code> to select between ACL or QoS data.
<b>stack-unit <i>number</i></b>	Enter the keywords <code>stack-unit</code> then a number to select a stack ID. The range is from 0 to 11.
<b>port-set 0-0</b>	Enter the keyword <code>port-set</code> with a port-pipe number. The range is from 0 to 0. The range is from 0 to 0.

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.0	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.

## show hardware stack-unit

Display the data plane or management plane input and output statistics of the designated component of the designated stack member.

**Syntax** `stack-unit <id> {buffer [ unit 0 ] total buffer | buffer unit 0 interface all queue [(0-14) | all] buffer-info}{cpu data-plane statistics | cpu management statistics | drops [unit number] | fpga register | party-bus statistics | stack-port | ti-monitor | unit 0-1 {counters | details | port-stats [detail] | register}}`

## Parameters

<b>stack-unit</b> <i>stack-unit</i> {command- option}	Enter the keywords <code>stack-unit</code> to select a particular stack member and then enter one of the following command options to display a collection of data based on the option entered. The range is 0 to 11.
<b>buffer</b>	Enter the keyword <code>buffer</code> . To display the total buffer statistics for the stack unit, enter the keyword <code>total-buffer</code> . To display buffer statistics for a all interface, enter the keyword <code>interface</code> followed by the keyword <code>all</code> . To display total buffer information for the port, enter the keywords <code>buffer-info</code> . To display a queue range, enter 0 to 14 for a specific queue or <code>all</code> .
<b>cpu data-plane statistics</b>	(Optional) Enter the keywords <code>cpu data-plane statistics</code> then the keywords <code>stack port</code> and its number, from 0 to 63 to display the data plane statistics, which shows the High Gig ( <code>Higig</code> ) port raw input/output counter statistics to which the stacking module is connected.
<b>cpu management statistics</b>	Enter the keywords <code>cpu management statistics</code> to display the counters of the management port.
<b>cpu party-bus statistics</b>	Enter the keywords <code>cpu party-bus statistics</code> , to display the Management plane input/output counter statistics of the pseudo party bus interface.
<b>drops [unit unit-number]</b>	Enter the keyword <code>drops</code> to display internal drops on the selected stack member. Enter the drops keyword to display internal drops on the selected stack member.
<b>fpga register</b>	Enter the keyword to display the register value of fpga register details in S4810, Z9000 and S6000.
<b>unit unit- number</b> {counters   details   port- stats [detail]   register}	Enter the keyword <code>unit</code> then 0 to 3 and then enter one of the following keywords to troubleshoot errors on the selected port-pipe and to give status on why a port is not coming up to register level: <code>counters</code> , <code>details</code> , <code>port-stats [detail]</code> , or <code>register</code> .
<b>TI monitor</b>	Enter the unit keyword to show information regarding the TI register.

## Defaults

none

## Command Modes

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.8(0.0)	Replaced the keyword <code>port</code> with <code>interface</code> .
9.7(0.0)	Introduced on the S6000-ON.
9.2(0.2)	Modified the <code>drops</code> keyword range, unit keyword range and added the <code>buffer</code> and <code>cpu management statistics</code> options.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.5	Added <code>i2c</code> statistics and <code>sata-interfaces</code> statistics.
8.3.11.4	Added user port information.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.7.1.0	Introduced on the S-Series.

## Example (Data-Plane)

```
Dell#show hardware stack-unit 1 cpu data-plane statistics
Input Statistics:
 1856 packets, 338262 bytes
 141 64-byte pkts, 1248 over 64-byte pkts, 11 over 127-byte
pkts
 222 over 255-byte pkts, 236 over 511-byte pkts, 0 over 1023-
byte pkts
 919 Multicasts, 430 Broadcasts
 0 runts, 0 giants, 0 throttles
 0 CRC, 0 overrun, 0 discarded
Output Statistics:
 325 packets, 27629 bytes, 0 underruns
 9 64-byte pkts, 310 over 64-byte pkts, 1 over 127-byte pkts
 1 over 255-byte pkts, 2 over 511-byte pkts, 2 over 1023-byte
pkts
 0 Multicasts, 3 Broadcasts, 322 Unicasts
 0 throttles, 0 discarded, 0 collisions
Rate info (interval 299 seconds):
 Input 00.00 Mbits/sec
 Output 00.00 Mbits/sec
Dell#
```

## Example (Party-Bus)

```
Dell#show hardware stack-unit 1 cpu party-bus statistics
Input Statistics:
 8189 packets, 8076608 bytes
 0 dropped, 0 errors
Output Statistics:
 366 packets, 133100 bytes
 0 errors
Dell#
```

**Example (Drops Unit)**

```
Dell#sh hard stack-unit 1 drops unit 0
PortNumberIngress Drops IngMac Drops Total Mmu Drops
1          0          0          0          0
2          0          0          0          0
3          0          0          0          0
4          0          0          0          0
EgMac Drops Egress Drops
0          0
0          0
0          0
0          0
Dell#
```

**Example (Port-Stats)**

```
Dell#show hardware stack-unit 1 unit 0 port-stats

**Related  
Commands**

[clear hardware system-flow](#) — clears the statistics from selected hardware components.

[show interfaces stack-unit](#) — displays information on all interfaces on a specific S-Series stack member.

[show processes cpu \(S-Series\)](#) — displays the CPU usage information based on the processes running in an S-Series.

[show system \(S-Series and Z-Series\)](#) — displays the current status of all the stack members or a specific member.

## show hardware buffer interface

Display buffer statistics for a specific interface.

**Syntax** `show hardware buffer interface interface{priority-group { id | all } | queue { id| all} ] buffer-info`

<b>Parameters</b>	<b>interface</b> <i>interface</i>	Enter any of the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li></ul>
	<b>priority-group</b>	Enter the keyword <code>priority-group</code> followed by <i>id</i> for specific priority-group or keyword <i>all</i> .
	<b>queue</b>	Enter the keyword <code>queue</code> followed by <i>id</i> for specific queue or keyword <i>all</i> .
	<b>buffer-info</b>	To display total buffer information for the interface, enter the keywords <code>buffer-info</code> .

**Command Modes**  
EXEC  
EXEC Privilege

<b>Command History</b>	<b>Version</b>	<b>Description</b>
	<b>9.8(0.0)</b>	Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, Z9000, Z9500.

**Example displaying total-buffer information for the interface**

```
Dell# show hardware buffer interface tengigabitethernet 1/1
buffer-info
----- Buffer Stats for Interface Te 1/1 -----
Maximum Shared Limit for the Interface: 38336
Default Packet Buffer allocate for the Interface: 120
Used Packet Buffer for the Interface: 0
```

**Example displaying priority-group range**

```
Dell#show hardware buffer interface tengigabitethernet 1/1
priority-group 0 buffer-info
----- Buffer stats for unit: 0 port: 1 (interface Te 1/1) -----

## show hardware buffer-stats-snapshot

Displays buffer statistics tracking resource information for a specific interface.

**Syntax**

```
show hardware buffer-stats-snapshot resource interface
interface{priority-group { id | all } | queue { ucast{id | all}
{ mcast {id | all} | all}}
```

<b>Parameters</b>	<b>buffer-stats-snapshot unit number</b>	Display the historical snapshot of buffer statistical values unit Enter the keyword <code>unit</code> along with a port-pipe number. The range is from 0 to 0.
	<b>interface interface</b>	Enter any of the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li></ul>
	<b>queue</b>	Enter the keyword <code>queue</code> after <code>id</code> for specific queue or keyword <code>all</code> .
	<b>priority-group</b>	Enter the keyword <code>priority-group</code> followed by <code>id</code> for specific priority-group or keyword <code>all</code> .

**Command Modes**

EXEC  
EXEC Privilege

<b>Command History</b>	<b>Version</b>	<b>Description</b>
	<b>9.8(0.0)</b>	Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, Z9000, Z9500.

**Usage Information**

<Interface><slot/port>-Queue ucast/mcast — Displays the total unicast/multicast buffer usage on per-port per-queue basis. For CPU port, counters for queues 0 to 11 displays and there is no differentiation between unicast and multicast queues.

**Example displaying egress queue-level snapshot for both unicast and multicast packets for the specific interface**

```
Dell# show hardware buffer-stats-snapshot resource interface
fortyGigE 0/0 queue all
Unit 0 unit: 0 port: 1 (interface Fo 0/0)
-----
Q# TYPE      Q#      TOTAL BUFFERED CELLS
-----
UCAST      0        0
UCAST      1        0
UCAST      2        0
UCAST      3        0
UCAST      4        0
UCAST      5        0
UCAST      6        0
UCAST      7        0
UCAST      8        0
UCAST      9        0
UCAST     10        0
UCAST     11        0
MCAST      0        0
MCAST      1        0
MCAST      2        0
MCAST      3        0
MCAST      4        0
MCAST      5        0
MCAST      6        0
MCAST      7        0
MCAST      8        0
```

**Example displaying egress queue-level snapshot for unicast packets for the specific interface**

```
Del#show hardware buffer-stats-snapshot resource interface
fortyGigE 0/0 queue ucast 10
Unit 0 unit: 0 port: 1 (interface Fo 0/0)
-----
Q# TYPE      Q#      TOTAL BUFFERED CELLS
-----
UCAST      10       0

Dell#show hardware buffer-stats-snapshot resource interface
fortyGigE 0/0 queue ucast all
Unit 0 unit: 0 port: 1 (interface Fo 0/0)
-----
Q# TYPE      Q#      TOTAL BUFFERED CELLS
-----
UCAST      0        0
UCAST      1        0
UCAST      2        0
UCAST      3        0
UCAST      4        0
UCAST      5        0
UCAST      6        0
UCAST      7        0
UCAST      8        0
UCAST      9        0
UCAST     10        0
UCAST     11        0
```

**Example displaying egress queue-level snapshot for multicast packets for the specific interface**

```
Dell#show hardware buffer-stats-snapshot resource interface
fortyGigE 0/0 queue mcast 3
Unit 1 unit: 0 port: 1 (interface Fo 0/0)
```

Q#	TYPE	Q#	TOTAL BUFFERED CELLS

```
Dell#show hardware buffer-stats-snapshot resource interface
fortyGigE 0/0 priority-group all
```

```
Unit 0 unit: 0 port: 1 (interface Fo 0/0)
```

PG#	SHARED CELLS	HEADROOM CELLS
0	0	0
1	0	0
2	0	0
3	0	0
4	0	0
5	0	0
6	0	0
7	0	0

## show hardware counters interface

Display the counter information for a specific interface.

**Syntax**            `show hardware counters interface interface`

## Parameters

- counters** Enter the keywords `counters` to display counter value for the specified stack-member the port-pipe.
- interface**  
**interface** Enter any of the following keywords and slot/port or number information:
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

## Defaults

none

## Command Modes

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
<b>9.8(0.0)</b>	Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, Z9500.

## Example

```
Dell#show hardware counters interfac tengigabitethernet 5/1
unit: 0 port: 2 (interface Te 5/1)
Description                                     Value
RX - IPV4 L3 Unicast Frame Counter              0
RX - IPV4 L3 Routed Multicast Packets           0
RX - IPV6 L3 Unicast Frame Counter              0
RX - IPV6 L3 Routed Multicast Packets           0
RX - Unicast Packet Counter                     0
RX - 64 Byte Frame Counter                      0
RX - 65 to 127 Byte Frame Counter               0
RX - 128 to 255 Byte Frame Counter              0
RX - 256 to 511 Byte Frame Counter              0
RX - 512 to 1023 Byte Frame Counter             0
RX - 1024 to 1518 Byte Frame Counter            0
RX - 1519 to 1522 Byte Good VLAN Frame Counter 0
RX - 1519 to 2047 Byte Frame Counter            0
RX - 2048 to 4095 Byte Frame Counter            0
RX - 4096 to 9216 Byte Frame Counter            0

<output truncated for brevity>

```

## show hardware drops

Displays internal drops on the specified interface or for a range of interface.

**Syntax** `show hardware drops interface interface`

**Parameters**

**interface** Enter any of the following keywords and slot/port or slot/port-range or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**drops** Enter the keyword `drops` to display internal drops.

**Command Modes**

EXEC

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.8(0.0)	Removed the keywords <code>stack-unit</code> . Introduced on the Z9500.
9.7(0.0)	Introduced on the S6000-ON.

Version	Description
9.2(0.2)	Modified the drops keyword range, unit keyword range and added the buffer and cpu management statistics options.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.5	Added i2c statistics and sata-interfaces statistics.
8.3.11.4	Added user port information.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.7.1.0	Introduced on the S-Series.

**Example  
displaying  
internal drops  
for the specific  
interface**

```
Dell#show hardware drops interface tengigabitethernet 2/1

## show hardware stack-unit buffer-stats-snapshot (Total Buffer Information)

View the buffer statistics tracking resource information depending on the type of buffer information, such as device-level details, port-level counters, queue-based snapshots, or priority group-level snapshot in the egress and ingress direction of traffic.

**Syntax** `show hardware stack-unit <id> buffer-stats-snapshot unit <id> resource x`

### Parameters

<b>stack-unit</b> <b>stack-unit-</b> <b>number</b>	Unique ID of the stack unit to select a particular stack member and then enter one of the following command options to display a collection of data based on the option entered. The unit ID range for the S4820T is from 0 to 11.
<b>buffer-stats-</b> <b>snapshot unit</b> <b>number</b>	Display the historical snapshot of buffer statistical values unit Enter the keyword <code>unit</code> along with a port-pipe number. The range is from 0 to 0.
<b>buffer-info</b>	Buffer and traffic manager resources usage, where X can be one of the following: <ul style="list-style-type: none"> <li>• All - Displays ingress and egress device, port, and queue snapshots</li> <li>• Interface all queue {all} - egress queue-level snapshot for both unicast and multicast packets</li> <li>• Interface all queue ucast {id   all} - egress queue-level snapshot for unicast packets only</li> <li>• Interface all queue mcast {id   all} - egress queue-level snapshot for multicast packets only</li> <li>• Interface all prio-group {id   all} - ingress priority-group level snapshot</li> </ul>

### Command Modes

EXEC

EXEC Privilege

## Command History

Version	Description
9.8(0.0)	Added the keyword <code>interface all</code> .
9.7(0.0)	Introduced on the S6000-ON.
9.6(0.0)	Introduced on the S5000.
9.3(0.0)	Introduced on the S6000, S4810, and S4820T.

## Usage Information

The following information is displayed based on the `buffer-info` type, such as device-level details, queue-based snapshots, or priority group-level snapshot in the egress and ingress direction of traffic:

- Device-ingress – Displays total buffer accounting usage for the unit.
- Device-egress – Display total buffer usage for the unit, total multicast buffer usage for the unit and also on per-service-pool basis. Counters will be displayed for the 2 service-pools – one for normal traffic and other for DCB traffic.

When the `buffer-stats-snapshot` is disabled, the following informational message is displayed when you run the `show` command: `%Info: Buffer-stats-snapshot feature is disabled.`

## Example

```
Dell#show hardware stack-unit 1 buffer-stats-snapshot unit 3
resource interface all queue mcast 3
Unit 1 unit: 3 port: 1 (interface Fo 1/144)
-----
Q# TYPE      Q#      TOTAL BUFFERED CELLS
-----
MCAST      3        0

Unit 1 unit: 3 port: 5 (interface Fo 1/148)
-----
Q# TYPE      Q#      TOTAL BUFFERED CELLS
-----
MCAST      3        0

Unit 1 unit: 3 port: 9 (interface Fo 1/152)
-----
Q# TYPE      Q#      TOTAL BUFFERED CELLS
-----
MCAST      3        0

Unit 1 unit: 3 port: 13 (interface Fo 1/156)
-----
Q# TYPE      Q#      TOTAL BUFFERED CELLS
-----
MCAST      3        0

Unit 1 unit: 3 port: 17 (interface Fo 1/160)
-----
Q# TYPE      Q#      TOTAL BUFFERED CELLS
-----
MCAST      3        0

Unit 1 unit: 3 port: 21 (interface Fo 1/164)
-----
Q# TYPE      Q#      TOTAL BUFFERED CELLS
```

```

-----
MCAST          3          0

Unit 1 unit: 3 port: 25 (interface Fo 1/168)
-----
Q# TYPE        Q#          TOTAL BUFFERED CELLS
-----
MCAST          3          0

Unit 1 unit: 3 port: 29 (interface Fo 1/172)
-----
Q# TYPE        Q#          TOTAL BUFFERED CELLS
-----
MCAST          3          0

Unit 1 unit: 3 port: 33 (interface Fo 1/176)
-----
Q# TYPE        Q#          TOTAL BUFFERED CELLS
-----
MCAST          3          0

Unit 1 unit: 3 port: 37 (interface Fo 1/180)
-----
Q# TYPE        Q#          TOTAL BUFFERED CELLS
-----

```

## show hardware system-flow

Display Layer 3 ACL or QoS data for the selected stack member and stack member port-pipe.

**Syntax** `show hardware system-flow layer2 stack-unit id port-set number [counters]`

**Parameters**

<b>acl   qos</b>	For the selected stack member and stack member port-pipe, display which system flow entry the packet hits and what queue the packet takes as it dumps the raw system flow tables.
<b>stack-unit <i>id</i></b>	Enter the keywords <code>stack-unit</code> to select a stack member ID. The range is from 0 to 11.
<b>port-set <i>number</i> [counters]</b>	Enter the keywords <code>port-set</code> with a port-pipe number. The range is from 0 to 0. (OPTIONAL) Enter the keyword <code>counters</code> to display hit counters for the selected ACL or QoS option.

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.

**Example**

```
Dell#show hardware system-flow layer2 stack-unit 1 port-set 0
counters
```

```

## show hardware vlan-counters

Display the hardware VLAN statistics.

<b>Syntax</b>	show hardware vlan-counters <i>vlan-id</i>	
<b>Parameters</b>	<i>vlan-id</i>	Enter the interface VLAN number. The range is from 1 to 4094.
<b>Defaults</b>	None	

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.7(0.0)	Introduced this command.

**Example**

```
Dell#show hardware vlan-counters 1
Counters for vlanid: 1
-----
Total number of inpackets: 0
Total number of inbytes: 0
Total number of outpackets: 0
Total number of outbytes: 0
Dell#
```

**Related Commands**

[clear hardware system-flow](#) — clears the statistics from selected hardware components.

# Dynamic Host Configuration Protocol (DHCP)

Dynamic host configuration protocol (DHCP) is an application layer protocol that dynamically assigns IP addresses and other configuration parameters to network end-stations (hosts) based on the configuration policies the network administrators determine.

The Dell Networking operating system supports the basic DHCP commands on this platform.

This chapter contains the following sections:

- [Commands to Configure the System to be a DHCP Server](#)
- [Commands to Configure Secure DHCP](#)

## Commands to Configure the System to be a DHCP Server

To configure the system to be a DHCP server, use the following commands.

### clear ip dhcp

Reset the DHCP counters.

#### S4820T

<b>Syntax</b>	<code>clear ip dhcp [binding {address}   conflict   server statistics]</code>	
<b>Parameters</b>	<b>binding</b>	Enter the keyword <code>binding</code> to delete all entries in the binding table.
	<b>address</b>	Enter the IP address to clear the binding entry for a single IP address.
	<b>conflicts</b>	Enter the keyword <code>conflicts</code> to delete all of the log entries created for IP address conflicts.
	<b>server statistics</b>	Enter the keywords <code>server statistics</code> to clear all the server counter information.
<b>Defaults</b>	none	

<b>Command Modes</b>	EXEC Privilege														
<b>Command History</b>	<p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> <table border="0"> <thead> <tr> <th>Version</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>9.7(0.0)</td> <td>Introduced on the S6000-ON.</td> </tr> <tr> <td>9.0.2.0</td> <td>Introduced on the S6000.</td> </tr> <tr> <td>8.3.19.0</td> <td>Introduced on the S4820T.</td> </tr> <tr> <td>8.3.11.1</td> <td>Introduced on the Z9000.</td> </tr> <tr> <td>8.3.7.0</td> <td>Introduced on the S4810.</td> </tr> <tr> <td>8.2.1.0</td> <td>Introduced on the C-Series and S-Series.</td> </tr> </tbody> </table>	Version	Description	9.7(0.0)	Introduced on the S6000-ON.	9.0.2.0	Introduced on the S6000.	8.3.19.0	Introduced on the S4820T.	8.3.11.1	Introduced on the Z9000.	8.3.7.0	Introduced on the S4810.	8.2.1.0	Introduced on the C-Series and S-Series.
Version	Description														
9.7(0.0)	Introduced on the S6000-ON.														
9.0.2.0	Introduced on the S6000.														
8.3.19.0	Introduced on the S4820T.														
8.3.11.1	Introduced on the Z9000.														
8.3.7.0	Introduced on the S4810.														
8.2.1.0	Introduced on the C-Series and S-Series.														
<b>Usage Information</b>	Entering <CR> after the <code>clear ip dhcp binding</code> command clears all the IPs from the binding table.														

## debug ip dhcp server

Display FTOS debugging messages for DHCP.

### S4820T

<b>Syntax</b>	<code>debug ip dhcp server [events   packets]</code>						
<b>Parameters</b>	<table border="0"> <tr> <td><b>events</b></td> <td>Enter the keyword <code>events</code> to display the DHCP state changes.</td> </tr> <tr> <td><b>packet</b></td> <td>Enter the keyword <code>packet</code> to display packet transmission/reception.</td> </tr> </table>	<b>events</b>	Enter the keyword <code>events</code> to display the DHCP state changes.	<b>packet</b>	Enter the keyword <code>packet</code> to display packet transmission/reception.		
<b>events</b>	Enter the keyword <code>events</code> to display the DHCP state changes.						
<b>packet</b>	Enter the keyword <code>packet</code> to display packet transmission/reception.						
<b>Defaults</b>	none						
<b>Command Modes</b>	EXEC Privilege						
<b>Command History</b>	<p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> <table border="0"> <thead> <tr> <th>Version</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>9.7(0.0)</td> <td>Introduced on the S6000-ON.</td> </tr> <tr> <td>9.0.2.0</td> <td>Introduced on the S6000.</td> </tr> </tbody> </table>	Version	Description	9.7(0.0)	Introduced on the S6000-ON.	9.0.2.0	Introduced on the S6000.
Version	Description						
9.7(0.0)	Introduced on the S6000-ON.						
9.0.2.0	Introduced on the S6000.						

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series and S-Series.

## debug ipv6 dhcp

To enable debug logs for DHCPv6 relay agent transactions.

**Syntax** `debug ipv6 dhcp`  
 To disable the debug logs for dhcpv6 relay agent transactions, use the `debug ipv6 dhcp` command.

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command-Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S4810, S4820T, S6000 and Z-Series.

## default-router

Assign a default gateway to clients based on the address pool.

### S4820T

**Syntax** `default-router address [address2...address8]`

**Parameters** **address** Enter a list of routers that may be the default gateway for clients on the subnet. You may specify up to eight routers. List them in order of preference.

**Defaults** none

**Command Modes** DHCP <POOL>

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series and S-Series.

## disable

Disable the DHCP server.

### S4820T

<b>Syntax</b>	<code>disable</code> DHCP Server is disabled by default. To enable the system to be a DHCP server, use the <code>no disable</code> command.
<b>Defaults</b>	Disabled
<b>Command Modes</b>	CONFIGURATION DHCP <POOL>
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series and S-Series.

## dns-server

Assign a DNS server to clients based on address pool.

### S4820T

<b>Syntax</b>	<code>dns-server address [address2...address8]</code>		
<b>Parameters</b>	<table><tr><td><b><i>address</i></b></td><td>Enter a list of DNS servers that may service clients on the subnet. You may list up to eight servers, in order of preference.</td></tr></table>	<b><i>address</i></b>	Enter a list of DNS servers that may service clients on the subnet. You may list up to eight servers, in order of preference.
<b><i>address</i></b>	Enter a list of DNS servers that may service clients on the subnet. You may list up to eight servers, in order of preference.		
<b>Defaults</b>	none		
<b>Command Modes</b>	DHCP <POOL>		
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .		

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series and S-Series.

## domain-name

Assign a domain to clients based on the address pool.

### S4820T

<b>Syntax</b>	<code>domain-name name</code>		
<b>Parameters</b>	<table><tr><td><b><i>name</i></b></td><td>Give a name to the group of addresses in a pool.</td></tr></table>	<b><i>name</i></b>	Give a name to the group of addresses in a pool.
<b><i>name</i></b>	Give a name to the group of addresses in a pool.		
<b>Defaults</b>	none		
<b>Command Modes</b>	DHCP <POOL>		

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series and S-Series.

## excluded-address

Prevent the server from leasing an address or range of addresses in the pool.

### S4820T

#### Syntax

```
excluded-address [address | low-address high-address]
```

#### Parameters

<b>address</b>	Enter a single address to be excluded from the pool.
<b>low-address</b>	Enter the lowest address in a range of addresses to be excluded from the pool.
<b>high-address</b>	Enter the highest address in a range of addresses to be excluded from the pool.

#### Defaults

none

#### Command Modes

DHCP

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.

Version	Description
8.2.1.0	Introduced on the C-Series and S-Series.

## hardware-address

For manual configurations, specify the client hardware address.

### S4820T

**Syntax** `hardware-address address`

**Parameters**

<b>address</b>	Enter the hardware address of the client.
----------------	---

**Defaults** none

**Command Modes** DHCP <POOL>

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series and S-Series.

## host

For manual (rather than automatic) configurations, assign a host to a single-address pool.

### S4820T

**Syntax** `host address`

**Parameters**

<b>address/mask</b>	Enter the host IP address and subnet mask.
---------------------	--

**Defaults** none

**Command Modes** DHCP <POOL>

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series and S-Series.

## lease

Specify a lease time for the addresses in a pool.

### S4820T

#### Syntax

```
lease {days [hours] [minutes] | infinite}
```

#### Parameters

<i>days</i>	Enter the number of days of the lease. The range is from 0 to 31.
<i>hours</i>	Enter the number of hours of the lease. The range is from 0 to 23.
<i>minutes</i>	Enter the number of minutes of the lease. The range is from 0 to 59.
<i>infinite</i>	Specify that the lease never expires.

#### Defaults

**24 hours**

#### Command Modes

DHCP <POOL>

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.

Version	Description
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series and S-Series.

## netbios-name-server

Specify the NetBIOS Windows Internet Naming Service (WINS) name servers, in order of preference, that are available to Microsoft Dynamic Host Configuration Protocol (DHCP) clients.

### S4820T

<b>Syntax</b>	<code>netbios-name-server address [address2...address8]</code>	
<b>Parameters</b>	<b>address</b>	Enter the address of the NETBIOS name server. You may enter up to eight, in order of preference.
<b>Defaults</b>	none	
<b>Command Modes</b>	DHCP <POOL>	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .	

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series and S-Series.

## netbios-node-type

Specify the NetBIOS node type for a Microsoft DHCP client. Dell Networking recommends specifying clients as `hybrid`.

### S4820T

<b>Syntax</b>	<code>netbios-node-type type</code>
---------------	-------------------------------------

## Parameters

### **type**

Enter the NETBIOS node type:

- Broadcast: Enter the keyword `b-node`.
- Hybrid: Enter the keyword `h-node`.
- Mixed: Enter the keyword `m-node`.
- Peer-to-peer: Enter the keyword `p-node`.

## Defaults

**Hybrid**

## Command Modes

DHCP <POOL>

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series and S-Series.

## network

Specify the range of addresses in an address pool.

### S4820T

#### Syntax

```
network network /prefix-length
```

#### Parameters

**network/  
prefix-length**

Specify a range of addresses. Prefix-length range is from 17 to 31.

#### Defaults

none

#### Command Modes

DHCP <POOL>

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series and S-Series.

## pool

Create an address pool.

### S4820T

**Syntax** `pool name`

**Parameters**

<b><i>name</i></b>	Enter the address pool's identifying name.
--------------------	--

**Defaults** none

**Command Modes** DHCP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series and S-Series.

## show ip dhcp binding

Display the DHCP binding table.

### S4820T

**Syntax** `show ip dhcp binding`

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series and S-Series.

## show ip dhcp configuration

Display the DHCP configuration.

### S4820T

**Syntax** `show ip dhcp configuration [global | pool name]`

**Parameters**

<b>pool <i>name</i></b>	Display the configuration for a DHCP pool.
<b>global</b>	Display the DHCP configuration for the entire system.

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series and S-Series.

## show ip dhcp conflict

Display the address conflict log.

### S4820T

**Syntax** `show ip dhcp conflict address`

**Parameters**

<b>address</b>	Display a particular conflict log entry.
----------------	--

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series and S-Series.

## show ip dhcp server

Display the DHCP server statistics.

### S4820T

<b>Syntax</b>	show ip dhcp server statistics	
<b>Defaults</b>	none	
<b>Command Modes</b>	EXEC Privilege	
<b>Command History</b>	<b>Version</b>	<b>Description</b>
	9.7(0.0)	Introduced on the S6000-ON.
	9.0.2.0	Introduced on the S6000.
	8.3.19.0	Introduced on the S4820T.
	8.3.11.1	Introduced on the Z9000.
	8.3.7.0	Introduced on the S4810.
	8.2.1.0	Introduced on the C-Series and S-Series.

## Commands to Configure Secure DHCP

DHCP, as defined by RFC 2131, provides no authentication or security mechanisms. Secure DHCP is a suite of features that protects networks that use dynamic address allocation from spoofing and attacks.

### arp inspection

Enable dynamic arp inspection (DAI) on a VLAN.

### S4820T

<b>Syntax</b>	arp inspection
<b>Defaults</b>	Disabled
<b>Command Modes</b>	INTERFACE VLAN
<b>Command History</b>	<p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p>

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the E-Series.
8.2.1.0	Introduced on the C-Series and S-Series.

**Related Commands** [arp inspection-trust](#) — specifies a port as trusted so that ARP frames are not validated against the binding table.

## arp inspection-trust

Specify a port as trusted so that ARP frames are not validated against the binding table.

### S4820T

<b>Syntax</b>	<code>arp inspection-trust</code>
<b>Defaults</b>	Disabled
<b>Command Modes</b>	<ul style="list-style-type: none"> <li>INTERFACE</li> <li>INTERFACE PORT-CHANNEL</li> </ul>

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the E-Series.
8.2.1.0	Introduced on the C-Series and S-Series.

**Related Commands** [arp inspection](#) — enables dynamic ARP inspection on a VLAN.

## clear ip dhcp snooping

Clear the DHCP binding table.

<b>Syntax</b>	<code>clear ip dhcp snooping {binding   source-address-validation discard-counters [interface <i>interface</i>]}</code>						
<b>Parameters</b>	<table><tr><td><b>binding</b></td><td>Clears the binding table.</td></tr><tr><td><b>source-address-validation discard-counters</b></td><td>Clears discard counters from all the interfaces configured with IP Source Guard.</td></tr><tr><td><b>interface <i>interface</i></b></td><td>(OPTIONAL) Specifies an interface to clear the discard counters.  Enter any of the following keywords and slot/port or number information:<ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li></ul></td></tr></table>	<b>binding</b>	Clears the binding table.	<b>source-address-validation discard-counters</b>	Clears discard counters from all the interfaces configured with IP Source Guard.	<b>interface <i>interface</i></b>	(OPTIONAL) Specifies an interface to clear the discard counters.  Enter any of the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li></ul>
<b>binding</b>	Clears the binding table.						
<b>source-address-validation discard-counters</b>	Clears discard counters from all the interfaces configured with IP Source Guard.						
<b>interface <i>interface</i></b>	(OPTIONAL) Specifies an interface to clear the discard counters.  Enter any of the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li></ul>						
<b>Defaults</b>	none						
<b>Command Modes</b>	EXEC Privilege						
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .						

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.6(0.0)	Added the keywords <code>discard-counters</code> , <code>interface</code> , and the variable <code>interface</code> on the S4810, S4820T, S5000, S6000, Z9000, Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.

Version	Description
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the E-Series.
8.2.1.0	Introduced on the C-Series and S-Series.

### Example

The following example shows how to clear the discard counters globally:

```
Dell> clear ip dhcp snooping source-address-validation discard-counters
```

The following example shows how to clear the discard counters on an interface:

```
Dell> clear ip dhcp snooping source-address-validation discard-counters interface TenGigE 1/10
```

The following example shows how to clear the discard counters on a port channel interface:

```
Dell> clear ip dhcp snooping source-address-validation discard-counters interface portchannel 1
```

### Related Commands

[show ip dhcp snooping](#) — displays the contents of the DHCP binding table.

## clear ipv6 dhcp snooping binding

Clear all the DHCPv6 snooping binding database entries.

**Syntax** `clear ipv6 dhcp snooping binding`

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command-Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S4810, S4820T, S6000 and Z-Series.

### Example

```
Dell# clear ipv6 dhcp snooping?
binding Clear the snooping binding database
```

## ip dhcp relay

Enable Option 82.

### S4820T

**Syntax** `ip dhcp relay information-option [remote-id | trust-downstream]`

**Parameters**

<b>remote-id</b>	Configure the system to enable the remote-id string in option-82.
<b>trust-downstream</b>	Configure the system to trust Option 82 when it is received from the previous-hop router.

**Defaults** Disabled

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.2(0.2)	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the E-Series.
7.8.1.0	Introduced on the C-Series and S-Series.

## ip dhcp snooping

Enable DHCP snooping globally.

### S4820T

**Syntax** `[no] ip dhcp snooping`

**Defaults** Disabled

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.2.(0.0)	Introduced on the S4810 and S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.1.0	Introduced on the E-Series.
8.2.1.0	Introduced on the C-Series and S-Series on Layer 2 interfaces.
7.8.1.0	Introduced on the C-Series and S-Series on Layer 3 interfaces.

#### Usage Information

When enabled, no learning takes place until you enable snooping on a VLAN. After disabling DHCP snooping, the binding table deletes and Option 82, IP Source Guard, and Dynamic ARP Inspection are disabled.

Introduced in Dell Networking OS version 7.8.1.0, DHCP snooping was available for Layer 3 only and dependent on DHCP Relay Agent (`ip helper-address`). Dell Networking OS version 8.2.1.0 extends DHCP Snooping to Layer 2. You do not have to enable relay agent to snoop on Layer 2 interfaces.

## ipv6 dhcp snooping

Enable DHCPv6 snooping globally for ipv6.

<b>Syntax</b>	<code>[no] ipv6 dhcp snooping</code> To disable the snooping globally, use the <code>no ipv6 dhcp snooping</code> command.
<b>Defaults</b>	Disabled
<b>Command Modes</b>	CONFIGURATION
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S4810, S4820T, S6000 and Z-Series.

## ipv6 dhcp snooping vlan

Enable ipv6 DHCP Snooping on VLAN or range of VLANs.

**Syntax** `[no] ip dhcp snooping vlan vlan-id`  
To disable the ipv6 dhcp snooping on VLAN basis or range of VLAN, use the `no ipv6 dhcp snooping vlan <vlan-id>` command.

**Parameters** ***vlan-id*** Enter the name of a VLAN id or list of the VLANs to enable DHCP Snooping.

**Defaults** Disabled

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command-Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S4810, S4820T, S6000 and Z-Series.

## ip dhcp snooping binding

Create a static entry in the DHCP binding table.

### S4820T

**Syntax** `[no] ip dhcp snooping binding mac address vlan-id vlan-id ip ip-address interface type slot/port lease number`

**Parameters**

<b><i>mac address</i></b>	Enter the keyword <code>mac</code> then the MAC address of the host to which the server is leasing the IP address.
<b><i>vlan-id vlan-id</i></b>	Enter the keywords <code>vlan-id</code> then the VLAN to which the host belongs. The range is from 2 to 4094.
<b><i>ip ip-address</i></b>	Enter the keyword <code>ip</code> then the IP address that the server is leasing.
<b><i>interface type</i></b>	Enter the keyword <code>interface</code> then the type of interface to which the host is connected: <ul style="list-style-type: none"><li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li></ul>

**slot/port** Enter the slot and port number of the interface.

**lease time** Enter the keyword `lease` then the amount of time the IP address are leased. The range is from 1 to 4294967295.

**Defaults** none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.5.1.0	Added support for 4-port 40G line cards on ExaScale.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the E-Series.
7.8.1.0	Introduced on the C-Series and S-Series.

**Related Commands** [show ip dhcp snooping](#) — displays the contents of the DHCP binding table.

## IPv6 DHCP Snooping Binding

Create a static DHCP snooping binding entry in the snooping database.

**Syntax**

```
[no] ipv6 dhcp snooping binding mac address vlan-id vlan-id
ipv6 ipv6-address interface interface-type | interface-number
lease value
```

To delete the DHCP snooping binding entry from DHCP snooping database, use the `[no] ipv6 dhcp snooping binding mac address vlan-id vlan-id ipv6 ipv6-address interface interface-type | interface-number lease value` command.

**Parameters**

**mac address** Enter the keyword `mac` then the MAC address of the host to which the server is leasing the IPv6 address.

**vlan-id** Enter the keywords `vlan-id` then the VLAN to which the host belongs. The range is from 2 to 4094.

<b>ipv6 ipv6-address</b>	Enter the keyword <code>ipv6</code> then the IPv6 address that is leased to the client.
<b>interface type</b>	Enter the keyword <code>interface</code> then the type of interface to which the host is connected: <ul style="list-style-type: none"> <li>For an 10/100 Ethernet interface, enter the keyword <code>fastethernet</code>.</li> <li>For a Gigabit Ethernet interface, enter the keyword <code>gigabitethernet</code>.</li> <li>For a Ten-Gigabit Ethernet interface, enter the keyword <code>tengigabitethernet</code>.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code>.</li> </ul>
<b>interface number</b>	Enter the number of the interface.
<b>lease value</b>	Enter the keyword <code>lease</code> then the amount of time the IPv6 address are leased. The range is from 1 to 4294967295.

**Defaults** none

**Command Modes**

- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S4810, S4820T, S6000 and Z-Series.

## ip dhcp snooping database

Delay writing the binding table for a specified time.

### S4820T

**Syntax** `ip dhcp snooping database write-delay minutes`

**Parameters**

***minutes*** The range is from 5 to 21600.

**Defaults** none

**Command Modes** CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the E-Series.
7.8.1.0	Introduced on the C-Series and S-Series.

### ipv6 dhcp snooping database write-delay

To set time interval for storing the snooping binding entries in a file.

**Syntax**

```
[no] ipv6 dhcp snooping database write-delay value
```

To disable the storing of snooping binding entries in a file, use the `no ipv6 dhcp snooping write-delay` command.

**Parameters**

**value** The range is from 5 to 21600. The value of the minutes range is from 5 min. to 15 days.

**Defaults**

none

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S4810, S4820T, S6000 and Z-Series.

## ip dhcp snooping database renew

Renew the binding table.

### S4820T

**Syntax** `ip dhcp snooping database renew`

**Defaults** none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the E-Series.
7.8.1.0	Introduced on the C-Series and S-Series.

## ipv6 dhcp snooping database renew

To load the binding entries from the file to DHCPv6 snooping binding database.

**Syntax** `ipv6 dhcp snooping database renew`

**Defaults** none

**Command Modes**

- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S4810, S4820T, S6000 and Z-Series.

## ip dhcp snooping trust

Configure an interface as trusted.

### S4820T

**Syntax** [no] ip dhcp snooping trust

**Defaults** **Untrusted**

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the E-Series.
7.8.1.0	Introduced on the C-Series and S-Series.

## ipv6 dhcp snooping trust

Configure an interface as trusted for DHCP snooping.

**Syntax** [no] ipv6 dhcp snooping trust

To disable dhcp snooping trusted capability on this interface, use the `no ipv6 dhcp snooping trust` command.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S4810, S4820T, S6000 and Z-Series.

## ip dhcp source-address-validation

Enable the IP Source Guard.

**Syntax** `[no] ip dhcp source-address-validation [ipmac] [vlan vlan-id]`

**Parameters**

<b>ipmac</b>	Enable IP+MAC Source Address Validation.
<b>vlan <i>vlan-id</i></b>	(OPTIONAL) SAV validates the source IP address along with the source VLAN ID against the DHCP snooping binding table.

**Defaults** Disabled

**Command Modes**

INTERFACE

INTERFACE PORTCHANNEL

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.6(0.0)	Added the <code>vlan</code> keyword and the <code>vlan-id</code> variable . Introduced support for SAV on port channels interfaces.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the E-Series.
8.2.1.0	Added the keyword <code>ipmac</code> .
7.8.1.0	Introduced on the C-Series and S-Series.

**Usage Information** Allocate at least one FP block to `ipmacacl` before you can enable IP+MAC Source Address Validation and SAV with VLAN option.

1. Use the `cam-acl 12acl` command from CONFIGURATION mode.
2. Save the running-config to the startup-config.

3. Reload the system.

## ip dhcp relay information-option

Enable Option 82.

### S4820T

**Syntax** `ip dhcp relay information-option [trust-downstream] [vpn]`

#### Parameters

**trust-downstream** Configure the system to trust Option 82 when it is received from the previous-hop router.

**vpn** Enter the keyword `vpn` to add VPN/VRF related sub-option to relay agent information Option 82.

**NOTE:** Adds the VPN/VRF related sub-options into the relay agent information option(82). When DHCP broadcasts are forwarded by the relay agent from clients to DHCP server.

**Default** Disabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.4(0.0)	Added support for VRF.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the E-Series.
7.8.1.0	Introduced on C-Series and S-Series.

**Example** `Dell(conf)#ip dhcp relay information-option vpn`

## ip dhcp snooping verify mac-address

Validate a DHCP packet's source hardware address against the client hardware address field (CHADDR) in the payload.

### S4820T

**Syntax** [no] ip dhcp snooping verify mac-address

**Defaults** Disabled

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the E-Series.
7.2.1.0	Introduced on the C-Series and S-Series.

## ipv6 dhcp snooping verify mac-address

**Syntax** [no] ipv6 dhcp snooping verify mac-address

To disable verify source mac-address against IPv6 DHCP packet MAC address, use the no ipv6 dhcp snooping verify mac-address command.

**Defaults** Disabled

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S4810, S4820T, S6000 and Z-Series.

## ip helper-address

Configures the destination broadcast address or the host address for DHCP server requests.

### S4820T

**Syntax** `ip helper-address [vrf vrf-name] ip-address`  
 To disable the destination broadcast address or the host address for DHCP server requests, use the `ip helper-address [vrf vrf-name] ip-address` command.

**Parameters**

<b>vrf vrf-name</b>	(Optional) Enter the keyword <code>vrf</code> and then the name of the VRF through which the host address can be reached.
<b>ip-address</b>	Enter an IP address through which the host address can be reached.

**Default** Disabled.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
Version 9.4.(0.0)	Introduced on the S-Series and Z-Series.

**Usage Information** Use this command on the interfaces where the DHCP clients are connected to forward the packets from clients to DHCP server and vice-versa.

**Example** `Dell(conf-if-te-1/12)#ip helper-address vrf jay 10.0.0.2`

## ipv6 helper-address

Configures the ipv6 DHCP helper addresses without VRF.

**Syntax** `[no] ipv6 helper-address ipv6-address`  
 To delete the ipv6 helper address, use the `[no] ipv6 helper-address ipv6-address` command.

<b>Parameters</b>	<b><i>ipv6-address</i></b>	Enter the keyword <code>ipv6-address</code> through which the server address can be reached.				
<b>Default</b>	Disabled.					
<b>Command Modes</b>	INTERFACE					
<b>Command History</b>	<p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> <table border="0" style="width: 100%;"> <thead> <tr> <th style="text-align: left;">Version</th> <th style="text-align: left;">Description</th> </tr> </thead> <tbody> <tr> <td style="vertical-align: top;"><b>9.7(0.0)</b></td> <td style="vertical-align: top;">Introduced on the S4810, S4820T, S6000, S6000-ON, Z9000, and Z9500.</td> </tr> </tbody> </table>		Version	Description	<b>9.7(0.0)</b>	Introduced on the S4810, S4820T, S6000, S6000-ON, Z9000, and Z9500.
Version	Description					
<b>9.7(0.0)</b>	Introduced on the S4810, S4820T, S6000, S6000-ON, Z9000, and Z9500.					
<b>Usage Information</b>	Use this command on the interfaces where the DHCP clients are connected to forward the packets from clients to DHCP server and vice-versa.					
<b>Example</b>	<pre>Dell (conf-if-te-0/0) #ipv6 helper-address X:X:X:X::X      IPv6 helper address VRF             VRF name. Global          Global address space</pre>					

## show ip dhcp snooping

Display the contents of the DHCP binding table or display the interfaces configured with IP Source Guard.

**Syntax** `show ip dhcp snooping [binding | source-address-validation [discard-counters [interface interface]]]`

<b>Parameters</b>	<b>binding</b>	Display the binding table.
	<b>source-address-validation</b>	Display the interfaces configured with IP Source Guard.
	<b>discard-counters</b>	(OPTIONAL) Display the number of dropped packets.
	<b>interface <i>interface</i></b>	(OPTIONAL) Specifies an interface to show the discard counters.
	<p>Enter any of the following keywords and slot/port or number information:</p> <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> </ul>	

- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.

**Defaults** none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.6(0.0)	Added the <code>discard-counters</code> , <code>interface</code> keywords, and the <code>interface</code> variable.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the E-Series.
7.8.1.0	Introduced on the C-Series and S-Series.

**Example** The following example displays the interfaces configured with IP Source Guard:

```
Dell> show ip dhcp snooping source-address-validation
ip sav access-list on TenGigabitEthernet 1/1
Total cam count 3
permit host 0.0.0.0 count (0 packets)
permit host 10.1.1.252 count (0 packets)
permit host 10.1.1.253 count (0 packets)
ipmac-vlan sav access-list on TenGigabitEthernet 1/2
Total cam count 4
permit host 0.0.0.0 host 00:00:00:00:00:00 count (0 packets)
permit vlan 10 host 10.1.1.1 host 00:00:00:aa:00:01 count (0
packets)
permit vlan 10 host 10.1.1.2 host 00:00:00:aa:00:02 count (0
packets)
permit vlan 20 host 10.2.2.1 host 00:00:00:aa:00:03 count (0
packets)
permit vlan 20 host 10.2.2.2 host 00:00:00:aa:00:04 count (0
packets)
```

The following example displays the port channel interfaces configured with IP Source Guard:

```
Dell> show ip dhcp snooping source-address-validation
interface portchannel 10
```

```

ipmac-vlan sav access-list on Port-channel 10 on stack-unit 0
Total cam count 5
permit host 0.0.0.0 host 00:00:00:00:00:00 count (0 packets)
permit vlan 10 host 1.1.1.1 host 00:00:00:00:01:01 count (0
packets)
permit vlan 10 host 1.1.1.2 host 00:00:00:00:01:02 count (0
packets)
permit vlan 10 host 1.1.1.3 host 00:00:00:00:01:03 count (0
packets)
ipmac-vlan sav access-list on Port-channel 10 on stack-unit 1
Total cam count 5
permit host 0.0.0.0 host 00:00:00:00:00:00 count (0 packets)
permit vlan 10 host 1.1.1.1 host 00:00:00:00:01:01 count (0
packets)
permit vlan 10 host 1.1.1.2 host 00:00:00:00:01:02 count (0
packets)
permit vlan 10 host 1.1.1.3 host 00:00:00:00:01:03 count (0
packets)
ipmac-vlan sav access-list on Port-channel 10 on stack-unit 2
Total cam count 5
permit host 0.0.0.0 host 00:00:00:00:00:00 count (0 packets)
permit vlan 10 host 1.1.1.1 host 00:00:00:00:01:01 count (0
packets)
permit vlan 10 host 1.1.1.2 host 00:00:00:00:01:02 count (0
packets)
permit vlan 10 host 1.1.1.3 host 00:00:00:00:01:03 count (0
packets)

```

**NOTE:** The output for port-channel interfaces does not display the physical interface.

The following example displays the SAV discard counters on all interfaces:

```

Dell> show ip dhcp snooping source-address-validation discard-
counters
deny access-list on TenGigabitEthernet 1/1
Total cam count 1
deny count (0 packets)
deny access-list on TenGigabitEthernet 1/2
Total cam count 2
deny vlan 10 count (0 packets)
deny vlan 20 count (0 packets)

```

The following example displays the SAV discard counters on a particular interface:

```

Dell> show ip dhcp snooping source-address-validation discard-
counters interface TenGigabitEthernet 1/1
deny access-list on TenGigabitEthernet 1/1
Total cam count 2
deny vlan 10 count (0 packets)
deny vlan 20 count (0 packets)

```

The following example displays the SAV discard counters on a port channel interface:

```

Dell> show ip dhcp snooping source-address-validation discard-
counters interface portchannel 10
deny access-list on Port-channel 10 on stack-unit 0
Total cam count 1
deny vlan 10 count (0 packets)
deny access-list on Port-channel 10 on stack-unit 1
Total cam count 1
deny vlan 10 count (0 packets)

```

```
deny access-list on Port-channel 10 on stack-unit 2
Total cam count 1
deny vlan 10 count (0 packets)
```

**NOTE:** The output for port-channel interfaces does not display the physical interface. If the LAG member interfaces belong to different stack-units, the counters are displayed per stack-unit for that port channel.

## show ipv6 dhcp snooping

Display the DHCPv6 snooping binding database.

**Syntax** show ipv6 dhcp snooping

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S4810, S4820T, S6000 and Z-Series.

### Example

```
Dell#show ipv6 dhcp snooping
IPv6 DHCP Snooping                : Enabled.
IPv6 DHCP Snooping Mac Verification : Disabled.

Database write-delay (In minutes)  : 5

DHCP packets information
Snooping packets                   : 0
Snooping packets processed on L2 vlans : 0

DHCP Binding File Details
Invalid File                         : 0
Invalid Binding Entry                : 0
Binding Entry lease expired          : 0

Dell#
```

# Commands to Configure DNS

To configure the Domain Names Systems (DNS) on the system, use the following commands:

## ip name-server

Configures the name server IP addresses for VRF. Using this command, you can configure up to a maximum of six IP addresses per VRF.

### S4820T

#### Syntax

```
ip name-server [vrf vrf-name] ip-address [ip-address2] [ip-address3] [ip-address4] [ip-address5] [ip-address6]
```

To undo the name server ip address configuration for VRF, use the `no ip name-server [vrf vrf-name] ip-address` command.

#### Parameters

**vrf vrf-name**

(Optional) Enter the key word `vrf` and then the name of the VRF to configure the name server IP addresses for that VRF.

**ip-address [ip-address2] [ip-address3] [ip-address4] [ip-address5] [ip-address6]**

Enter the IP address of the name server in dotted decimal format.

**NOTE:** Use the additional `ip-address` parameters (`ip-address2` to `ip-address6`) in a sequential order to specify up to a maximum of six IP addresses per VRF.

#### Defaults

None

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.4.(0.0)	Introduced on the S-Series and Z-Series.

#### Usage Information

Use this command to associate name server IP addresses to a specific VRF.

#### Example

```
• Dell(conf)#ip name-server vrf jay 2.2.2.2
• Dell(conf)#ip name-server vrf jay 2.2.2.2 3.3.3.3 4.4.4.4 5.5.5.5 6.6.6.6 7.7.7.7
```

## ip domain-name

Configures the default domain corresponding to a specific VRF. This domain is appended to the in complete DNS requests corresponding to the specified VRF.

### S4820T

<b>Syntax</b>	<code>ip domain-name [vrf vrf-name] name</code> To undo the domain name configuration corresponding to a specific VRF, use the <code>no ip domain-name [vrf vrf-name] name</code> command.						
<b>Parameters</b>	<table><tr><td><b>vrf vrf-name</b></td><td>(Optional) Enter the key word <code>vrf</code> and then the name of the VRF to configure the domain corresponding to that VRF.</td></tr><tr><td><b>name</b></td><td>Enter the name of the domain to be appended to the in complete DNS requests corresponding to the specified VRF.</td></tr></table>	<b>vrf vrf-name</b>	(Optional) Enter the key word <code>vrf</code> and then the name of the VRF to configure the domain corresponding to that VRF.	<b>name</b>	Enter the name of the domain to be appended to the in complete DNS requests corresponding to the specified VRF.		
<b>vrf vrf-name</b>	(Optional) Enter the key word <code>vrf</code> and then the name of the VRF to configure the domain corresponding to that VRF.						
<b>name</b>	Enter the name of the domain to be appended to the in complete DNS requests corresponding to the specified VRF.						
<b>Defaults</b>	None						
<b>Command Modes</b>	EXEC						
<b>Command History</b>	<p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> <table><thead><tr><th>Version</th><th>Description</th></tr></thead><tbody><tr><td>9.7(0.0)</td><td>Introduced on the S6000-ON.</td></tr><tr><td>9.4.(0.0)</td><td>Introduced on the S-Series and Z-Series.</td></tr></tbody></table>	Version	Description	9.7(0.0)	Introduced on the S6000-ON.	9.4.(0.0)	Introduced on the S-Series and Z-Series.
Version	Description						
9.7(0.0)	Introduced on the S6000-ON.						
9.4.(0.0)	Introduced on the S-Series and Z-Series.						
<b>Usage Information</b>	Use this command to configure a domain name corresponding to a VRF. This domain is appended to the in complete DNS requests corresponding to the specified VRF.						
<b>Example</b>	<pre>Dell(conf)#ip domain-name vrf jay dell.com</pre>						

## ip domain-list

Adds a domain name to the DNS list. This domain name is appended to incomplete host names in DNS requests corresponding to a specific VRF.

### S4820T

<b>Syntax</b>	<code>ip domain-list [vrf vrf-name] name</code> To remove a domain name from DNS list, use the <code>no ip domain-list [vrf vrf-name] name</code> command.
---------------	---

<b>Parameters</b>	<b>vrf vrf-name</b>	(Optional) Enter the key word <code>vrf</code> and then the name of the VRF to add a domain name to the DNS list corresponding to that VRF.
	<b>name</b>	Enter the name of the domain to be appended to the DNS list corresponding to the VRF.

**Defaults** None

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.4.(0.0)	Introduced on the S-Series and Z-Series.

**Usage Information** Use this command to add domain names to the DNS lists corresponding to a specific VRF. You can add up to a maximum of six domain names to the DNS list corresponding to a VRF. This domain is used to complete the unqualified host names.

**Example**

```
Dell(conf)#ip domain-list vrf jay dell.com
Dell(conf)#ip domain-list vrf jay force10.com
```

## ip host

Configures a mapping between the host name server and the IP address for a specific VRF. This mapping information is used by the name-to-IP address table to resolve host names.

### S4820T

**Syntax**

```
ip host [vrf vrf-name] name ip-address
```

To undo the host name server to IP address mapping for VRFs, use the `no ip host [vrf vrf-name] name ip-address` command.

<b>Parameters</b>	<b>vrf vrf-name</b>	(Optional) Enter the key word <code>vrf</code> and then the name of the VRF to configure the name server to IP address mapping for that VRF.
	<b>name</b>	Enter the name of the host to be associated with an IP address.
	<b>ip-address</b>	Enter the IP address of the name server in dotted decimal format.

<b>Defaults</b>	None						
<b>Command Modes</b>	CONFIGURATION						
<b>Command History</b>	<p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> <table border="0"> <thead> <tr> <th>Version</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>9.7(0.0)</td> <td>Introduced on the S6000-ON.</td> </tr> <tr> <td>9.4.(0.0)</td> <td>Introduced on the S-Series and Z-Series.</td> </tr> </tbody> </table>	Version	Description	9.7(0.0)	Introduced on the S6000-ON.	9.4.(0.0)	Introduced on the S-Series and Z-Series.
Version	Description						
9.7(0.0)	Introduced on the S6000-ON.						
9.4.(0.0)	Introduced on the S-Series and Z-Series.						
<b>Usage Information</b>	Use this command to create a mapping between a host name server and its IP addresses for a specific VRF.						
<b>Example</b>	<pre>Dell(conf)#ip host vrf jay dell 1.1.1.1</pre>						

## clear host

Removes one or all dynamically learned host table entries for a specific VRF.

### S4820T

<b>Syntax</b>	<pre>clear host [vrf vrf-name] [*   host-name]</pre>						
<b>Parameters</b>	<p><b>vrf vrf-name</b> (Optional) Enter the key word <code>vrf</code> and then the name of the VRF to delete dynamically learned host table entries corresponding to that VRF.</p> <p><b>host-name</b> Enter the name of the host corresponding to which you want to delete the dynamically learnt host table entries.</p> <p><b>*</b> Enter * to delete all host table entries.</p>						
<b>Defaults</b>	None						
<b>Command Modes</b>	EXEC						
<b>Command History</b>	<p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> <table border="0"> <thead> <tr> <th>Version</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>9.7(0.0)</td> <td>Introduced on the S6000-ON.</td> </tr> <tr> <td>9.4.(0.0)</td> <td>Introduced on the S-Series and Z-Series.</td> </tr> </tbody> </table>	Version	Description	9.7(0.0)	Introduced on the S6000-ON.	9.4.(0.0)	Introduced on the S-Series and Z-Series.
Version	Description						
9.7(0.0)	Introduced on the S6000-ON.						
9.4.(0.0)	Introduced on the S-Series and Z-Series.						

**Usage  
Information**

Use this command to delete one or all dynamically learned host table entries corresponding to a specific VRF.

**Example**

```
Dell#clear host vrf jay dell  
Dell#clear host vrf jay *
```

# Equal Cost Multi-Path (ECMP)

Equal cost multi-path (ECMP) is supported on the Dell Networking OS.

## ecmp-group

Provides a mechanism to monitor traffic distribution on an ECMP link bundle. A system log is generated when the standard deviation of traffic distribution on a member link exceeds a defined threshold.

### S4820T

<b>Syntax</b>	<pre>ecmp-group {<i>ecmp-group-id</i> interface <i>interface</i>   link-bundle-monitor}</pre> <p>To remove the selected interface, use the <code>ecmp-group no interface</code> command.</p> <p>To disable link bundle monitoring, use the <code>ecmp-group no link-bundle-monitor</code> command.</p>				
<b>Parameters</b>	<table> <tr> <td style="vertical-align: top;"><b><i>ecmp-group ID</i></b></td> <td>Enter the identifier number for the ECMP group. The range is from 2 to 64.</td> </tr> <tr> <td style="vertical-align: top;"><b><i>interface</i></b></td> <td>           Enter the following keywords and slot/port to add the interface to the ECMP group:           <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>• For a LAG interface, enter the keywords <code>port-channel</code> then the slot/port information. The range is from 1 to 128.</li> </ul> </td> </tr> </table>	<b><i>ecmp-group ID</i></b>	Enter the identifier number for the ECMP group. The range is from 2 to 64.	<b><i>interface</i></b>	Enter the following keywords and slot/port to add the interface to the ECMP group: <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>• For a LAG interface, enter the keywords <code>port-channel</code> then the slot/port information. The range is from 1 to 128.</li> </ul>
<b><i>ecmp-group ID</i></b>	Enter the identifier number for the ECMP group. The range is from 2 to 64.				
<b><i>interface</i></b>	Enter the following keywords and slot/port to add the interface to the ECMP group: <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>• For a LAG interface, enter the keywords <code>port-channel</code> then the slot/port information. The range is from 1 to 128.</li> </ul>				
<b>Defaults</b>	Off				
<b>Command Modes</b>	<ul style="list-style-type: none"> <li>• CONFIGURATION</li> <li>• CONFIGURATION ECMP-GROUP</li> </ul>				
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .				

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.10.0	Introduced on the S4810.

**Usage Information** Using CONFIGURATION mode, create an ECMP group ID. You can then assign interfaces to the ECMP group using CONFIGURATION ECMP-GROUP mode. You can also enable on the port-channel configuration using the CONFIGURATION ECMP-GROUP command mode.

## hash-algorithm

Changes the hash algorithm used to distribute traffic flows across a Port Channel. The ECMP and LAG options are supported on the Z-Series.

### S4820T

**Syntax**

```
hash-algorithm {algorithm-number | {ecmp {crc16 | crc16cc | crc32MSB | crc32LSB | crc-upper | dest-ip | lsb | xor1 | xor2 | xor4 | xor8 | xor16} [number] hg {crc16 | crc16cc | crc32MSB | crc32LSB | xor1 | xor2 | xor4 | xor8 | xor16} stack-unit stack-unit-number | port-set port-pipe | hg-seed seed-value stack-unit | lag {checksum | crc | xor} [number] nh-ecmp {checksum | crc | xor}[number] stack-unit number ip-sa-mask value ip-da-mask value | seed seed-value }
```

To return to the default hash algorithm, use the `no hash-algorithm` command.

To return to the default ECMP hash algorithm, use the `no hash-algorithm ecmp algorithm-value` command.

To remove the hash algorithm on a particular stack-unit, use the `no hash-algorithm linecard number` command.

**Parameters**

<b><i>algorithm-number</i></b>	Enter the algorithm number. The range is from 0 to 47.
--------------------------------	--

**ecmp** *crc16* |  
*crc16cc* |  
*crc32MSB* |  
*crc32LSB* | *crc-*  
*upper* | *dest-ip*  
| *lsb* | *xor1* |  
*xor2* | *xor4* |  
*xor8* | *xor16*

TeraScale and ExaScale Only: Enter the keyword `ecmp` then one of the following options:

- *crc16*: Use CRC16\_BISYNC — 16 bit CRC16-bisync polynomial (default)
- *crc16cc*: Use CRC16\_CCITT — 16 bit CRC16 using CRC16-CCITT polynomial
- *crc32MSB*: Use CRC32\_UPPER — MSB 16 bits of computed CRC32
- *crc32LSB*: Use CRC32\_LOWER — LSB 16 bits of computed CRC32
- *crc-upper*: Uses the upper 32 bits of the key for the hash computation
- *dest-ip*: Uses the destination IP for ECMP hashing
- *lsb*: Returns the LSB of the key as the hash
- *xor1*: Use CRC16\_BISYNC\_AND\_XOR1 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor1
- *xor2*: Use CRC16\_BISYNC\_AND\_XOR2 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor2
- *xor4*: Use CRC16\_BISYNC\_AND\_XOR4 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor4
- *xor8*: Use CRC16\_BISYNC\_AND\_XOR8 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor8
- *xor16*: Use CR16 — 16 bit XOR

**hg** {*crc16* |  
*crc16cc* |  
*crc32MSB* |  
*crc32LSB* | *xor1*  
| *xor2* | *xor4* |  
*xor8* | *xor16*}  
*stack-unit*  
*stack-unit-*  
*number* | *port-*  
*set port-pipe*

Z-Series only: Enter the keyword `hg` then one of the following options:

- *crc16*: Use CRC16\_BISYNC — 16 bit CRC16-bisync polynomial (default)
- *crc16cc*: Use CRC16\_CCITT — 16 bit CRC16 using CRC16-CCITT polynomial
- *crc32MSB*: Use CRC32\_UPPER — MSB 16 bits of computed CRC32
- *crc32LSB*: Use CRC32\_LOWER — LSB 16 bits of computed CRC32
- *xor1*: Use CRC16\_BISYNC\_AND\_XOR1 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor1
- *xor2*: Use CRC16\_BISYNC\_AND\_XOR2 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor2
- *xor4*: Use CRC16\_BISYNC\_AND\_XOR4 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor4
- *xor8*: Use CRC16\_BISYNC\_AND\_XOR8 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor8
- *xor16*: Use CR16 — 16 bit XOR

Enter the keywords `stack-unit`, then a `stack-unit number`, to specify a stack-unit.

Enter the keywords `port-set` `port-pipe` then the port pipe number. The range is from 0 to 5.

**hg-seed seed-value stack-unit**

Z-Series only: Enter the keywords `hg-seed` then the hash algorithm seed value. The range is from 0 to 2147483646.  
Enter the keywords `stack-unit` then the stack unit number.

Enter the keywords `port-set` then the stack-unit port-pipe number.

**lag hash algorithm**

Z-Series only: Enter the keywords `hg-seed` . The range is from 0 to 47.

**nh-ecmp hashalgorithm value**

(OPTIONAL) Enter the keyword **nh-ecmp** followed by the ECMP hash algorithm value.

**stack-unit number**

(OPTIONAL) : Enter the keyword **stack-unit** followed by the stack-unit slot number.

**ip-sa-mask value**

(OPTIONAL) Enter the keyword **ip-sa-mask** followed by the ECMP/LAG hash mask value. The range is from 0 to FF.

**ip-da-mask value**

(OPTIONAL) Enter the keyword **ip-da-mask** followed by the ECMP/LAG hash mask value. The range is from 0 to FF.

#### Defaults

IPSA and IPDA mask value is **FF** for the stack-unit.

#### Command Modes

#### CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.10.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.8.1.0	Added the <code>nh-ecmp</code> option.

Version	Description
7.7.1.1	Added the <code>nh-ecmp</code> option.

### Usage Information

To ensure that CRC is not used for LAG, set the default hash-algorithm method on ExaScale systems. For example, `hash-algorithm ecmp xor lag checksum nh-ecmp checksum`.

The hash value calculated with the `hash-algorithm` command is unique to the entire chassis. The `hash-algorithm` command with the `stack-unit` option changes the hash for a particular stack-unit by applying the mask specified in the `IPSA` and `IPDA` fields.

The `stack-unit` option is applicable with the `lag-hash-align` microcode only. Any other microcode returns an error message as follows:

- `Dell(conf)#hash-algorithm linecard 5 ip-sa-mask ff ip-da-mask ff`
- `% Error: This command is not supported in the current microcode configuration`

In addition, the `linecard number ip-sa-mask value ip-da-mask value` option has the following behavior to maintain bi-directionality:

- When hashing is done on both `IPSA` and `IPDA`, the `ip-sa-mask` and `ip-da-mask` values must be equal. (Single Linecard).
- When hashing is done only on `IPSA` or `IPDA`, Dell Networking OS maintains bi-directionality with masks set to `XX 00` for stack-unit 1 and `00 XX` for stack-unit 2 (`ip-sa-mask` and `ip-da-mask`). The mask value must be the same for both stack-units when using multiple stack-units as ingress (where `XX` is any value from `00` to `FF` for both stack-units). For example, assume that traffic is flowing between linecard 1 and linecard 2:
- `hash-algorithm linecard 1 ip-sa-mask aa ip-da-mask 00`
- `hash-algorithm linecard 2 ip-sa-mask 00 ip-da-mask aa`

The different hash algorithms are based on the number of Port Channel members and packet values. The default hash algorithm (number 0) yields the most balanced results in various test scenarios, but if the default algorithm does not provide a satisfactory distribution of traffic, use the `hash-algorithm` command to designate another algorithm.

When a Port Channel member leaves or is added to the Port Channel, the hash algorithm is recalculated to balance traffic across the members.

# hash-algorithm ecmp

Change the hash algorithm used to distribute traffic flows across an ECMP (equal-cost multipath routing) group.

## S4820T

**Term heading**      **Description heading**

**Syntax**

`hash-algorithm ecmp {crc-upper} | {dest-ip} | {lsb}`

To return to the default hash algorithm, use the `no hash-algorithm ecmp` command.

**Parameters**

- |                  |   |
|------------------|---|
| <b>crc-upper</b> | Uses the upper 32 bits of the key for the hash computation. The default is <b>crc-lower</b> . |
| <b>dest-ip</b>   | Uses the destination IP for ECMP hashing. The default is <b>enabled</b> .                     |
| <b>lsb</b>       | Returns the LSB of the key as the hash. The default is <b>crc-lower</b> .                     |

**Defaults**

- **crc-lower**
- **dest-ip enabled**

**Command Modes**      CONFIGURATION

**Command History**      This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.1.1.0</b>	Introduced on the E-Series ExaScale.
<b>7.6.1.0</b>	Introduced on the S-Series.
<b>7.5.1.0</b>	Introduced on the C-Series.

**Usage Information**      The hash value calculated with the `hash-algorithm` command is unique to the entire chassis. The default ECMP hash configuration is **crc-lower**. This command takes the lower 32 bits of the hash key to compute the egress port and is the “fall-back” configuration if you have not configured anything else.

<b>Term heading</b>	<b>Description heading</b>
	<p>The different hash algorithms are based on the number of ECMP group members and packet values. The default hash algorithm yields the most balanced results in various test scenarios, but if the default algorithm does not provide satisfactory distribution of traffic, use this command to designate another algorithm.</p> <p>When a member leaves or is added to the ECMP group, the hash algorithm is recalculated to balance traffic across the members.</p>

## hash-algorithm seed

Select the seed value for the ECMP, LAG, and NH hashing algorithm.

### S4820T

<b>Syntax</b>	<code>hash-algorithm seed value [stack-unit slot/port] [port-set number]</code>	
<b>Parameters</b>	<b>seed value</b>	Enter the keyword <code>seed</code> then the seed value. The range is from 0 to 2,147,483,646.
	<b>stack-unit slot/port</b>	Enter the keyword <code>stack-unit</code> then the slot/port number. The range is from 0 to 11.
	<b>port-set number</b>	Enter the keyword <code>port-set</code> then the port-pipe number. The value is 0.
<b>Defaults</b>	None	
<b>Command Modes</b>	CONFIGURATION	
<b>Command History</b>	<p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p>	

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Introduced on the E-Series.

## Usage Information

Deterministic ECMP sorts ECMPs in order even though RTM provides them in a random order. However, the hash algorithm uses as a seed the lower 12 bits of the chassis MAC, which yields a different hash result for every chassis. This behavior means that for a given flow, even though the prefixes are sorted, two unrelated chassis select different hops.

FTOS provides a CLI-based solution for modifying the hash seed to ensure that on each configured system, the ECMP selection is same. When configured, the same seed is set for ECMP, LAG, and NH, and is used for incoming traffic only.

**NOTE:** While the seed is stored separately on each port-pipe, the same seed is used across all CAMs.

You cannot separate LAG and ECMP but you can use different algorithms across the chassis with the same seed. If LAG member ports span multiple port-pipes and line cards, set the seed to the same value on each port-pipe to achieve deterministic behavior.

If the hash algorithm configuration is removed, the hash seed does not go to the original factory default setting.

## ip ecmp-group

Enable and specify the maximum number of ecmp that the L3 CAM hold for a route, By default, when maximum paths are not configured, the CAM can hold a maximum of 16 ecmp per route.

### S4820T

#### Syntax

```
ip ecmp-group {maximum-paths | {number} {path-fallback}}
```

To negate a command, use the `no ip ecmp-group maximum-paths {number}` command.

#### Parameters

<b>maximum-paths</b>	Specify the maximum number of ECMP for a route. The range is 2 to 64.
<b>path-fallback</b>	Use the keywords <code>path-fallback</code> to enable this feature. If you enable the feature, re-enter this keyword to disable the feature.

**Defaults** 16

**Command Modes** CONFIGURATION

<b>Command History</b>	<b>Version</b>	<b>Description</b>
	9.7(0.0)	Introduced on the S6000-ON.

Version	Description
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.10.0	Introduced on the S4810.

**Usage Information** You must save the new ECMP settings to the startup-config (`write mem`) then reload the system for the new settings to take effect.

**Related Commands** [show ip cam stack-unit](#) – Display content-addressable memory (CAM) entries for an S-Series switch.

## ip ecmp weighted

Enables weighted ECMP calculations.

**Syntax** `ip ecmp weighted`  
To disable weighted ECMP calculations, enter the `no ip ecmp weighted` command.

**Defaults** N/A

**Command Modes** CONFIGURATION

**Command History**

Version	Description
9.7(0.0)	Introduced on the S-Series.

**Usage Information** Enabling this CLI would inform the FIB to re-program the destination prefix paths with weights in the HW/CAM on the fly.

If disabled, the CLI would inform the FIB to re-program the destination prefix paths with no weights or regular ECMP.

**Example**

```
Dell(conf)#ip ecmp ?
weighted          Enables Weighted ECMP
Dell(conf)#ip ecmp weighted
Dell(conf)#do show running-config | grep ecmp
ip ecmp weighted
Dell(conf)#
Dell(conf)#no ip ecmp ?
weighted          Disables Weighted ECMP
Dell(conf)#no ip ecmp weighted
Dell(conf)#do show running-config | grep ecmp
```

## link-bundle-distribution trigger-threshold

Provides a mechanism to set the threshold to trigger when traffic distribution begins being monitored on an ECMP link bundle.

### S4820T

<b>Syntax</b>	<code>link-bundle-distribution trigger-threshold [percent]</code> To exit from ecmp group mode, use the <code>exit</code> command.		
<b>Parameters</b>	<table><tr><td><i>percent</i></td><td>Indicate the threshold value when traffic distribution starts being monitored on an ECMP link bundle. The range is from 1 to 90%. The default is <b>60%</b>.</td></tr></table>	<i>percent</i>	Indicate the threshold value when traffic distribution starts being monitored on an ECMP link bundle. The range is from 1 to 90%. The default is <b>60%</b> .
<i>percent</i>	Indicate the threshold value when traffic distribution starts being monitored on an ECMP link bundle. The range is from 1 to 90%. The default is <b>60%</b> .		
<b>Command Modes</b>	EXEC Privilege		
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .		

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.10.0	Introduced on the S4810.

## link-bundle-monitor enable

Provides a mechanism to enable monitoring of traffic distribution on an ECMP link bundle.

### S4820T

<b>Syntax</b>	<code>link-bundle-monitor enable</code> To exit from ECMP group mode, use the <code>exit</code> command.
<b>Command Modes</b>	<ul style="list-style-type: none"><li>ECMP-GROUP</li></ul>

- PORT-CHANNEL INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
9.0.0.0	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.10.0	Introduced on the S4810.

## show config

Display the ECMP configuration.

### S4820T

**Syntax**

`show config`

**Command Modes**

CONFIGURATION-ECMP-GROUP

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.

**Related Commands**

[show running-config ecmp-group](#) — displays interfaces, LAG, or LAG link bundles being monitored for uneven traffic distribution.

## show link-bundle distribution

Display the link-bundle distribution for the interfaces in the bundle, type of bundle (LAG or ECMP), and the most recently calculated interface utilization (either bytes per second rate or maximum rate) for each interface.

### S4820T

**Syntax** `show link-bundle-distribution`

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.

### Example

```
Dell#show link-bundle-distribution
Link-bundle trigger threshold - 30

ECMP bundle - 64      Utilization[In Percent] - 0      Alarm
State - Inactive

Interface              Line Protocol  Utilization[In
Percent]
Te 1/1                 Up             0
Po 128                 Up             0
Po 100                 Up             0
Dell#
```

# FIPS Cryptography

To configure federal information processing standards (FIPS) cryptography, use the following commands:

## fips mode enable

Enable the FIPS cryptography mode on the platform.

<b>Syntax</b>	<code>[no] fips mode enable</code> To disable the FIPS cryptography mode, use the <code>no fips mode enable</code> command.								
<b>Default</b>	Disabled								
<b>Command Modes</b>	CONFIGURATION								
<b>Example</b>	<pre>Dell (conf)#fips mode enable WARNING: Enabling FIPS mode will close all SSH/Telnet connection, restart those servers, and destroy all configured host keys. proceed (y/n) ? y Dell (conf)#</pre>								
<b>Command History</b>	<p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> <table> <thead> <tr> <th>Version</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>9.1(0.0)</td> <td>Introduced on the Z9000.</td> </tr> <tr> <td>8.3.19.0</td> <td>Introduced on the S4820T.</td> </tr> <tr> <td>8.3.12.0</td> <td>Introduced on the S4810.</td> </tr> </tbody> </table>	Version	Description	9.1(0.0)	Introduced on the Z9000.	8.3.19.0	Introduced on the S4820T.	8.3.12.0	Introduced on the S4810.
Version	Description								
9.1(0.0)	Introduced on the Z9000.								
8.3.19.0	Introduced on the S4820T.								
8.3.12.0	Introduced on the S4810.								

## show fips status

Displays the status of the FIPS mode.

<b>Syntax</b>	<code>show fips status</code>
<b>Defaults</b>	None
<b>Command Modes</b>	EXEC
<b>Example</b>	<pre>Dell#show fips status FIPS Mode      : Disabled Dell#  Dell#show fips status FIPS Mode      : Enabled Dell#</pre>

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.1(0.0)	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

## show ip ssh

Display information about established SSH sessions

<b>Syntax</b>	<code>show ip ssh</code>
<b>Defaults</b>	none
<b>Command Modes</b>	EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.1(0.0)	Introduced on the Z9000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on S4810.

**Example**

```
Dell#show ip ssh
SSH server          : enabled.
SSH server version  : v2.
SSH server vrf      : default.
SSH server ciphers  : 3des-cbc,aes128-cbc,aes192-
cbc,aes256-cbc,aes128-ctr,aes192-ctr,aes256-ctr.
SSH server macs     : hmac-shal-96.
SSH server kex algorithms : diffie-hellman-group14-shal.
Password Authentication : enabled.
Hostbased Authentication : disabled.
RSA Authentication   : disabled.
  Vty      Encryption      HMAC      Remote IP
```

**With FIPS Mode enabled:**

```
Dell#show ip ssh
SSH server          : enabled.
SSH server version  : v2.
SSH server vrf      : default.
SSH server ciphers  : 3des-cbc,aes128-cbc,aes192-
cbc,aes256-cbc,aes128-ctr,aes192-ctr,aes256-ctr.
SSH server macs     : hmac-shal-96.
SSH server kex algorithms : diffie-hellman-group14-shal.
Password Authentication : enabled.
Hostbased Authentication : disabled.
RSA Authentication   : disabled.
  Vty      Encryption      HMAC      Remote IP
0 3des-cbc hmac-shal-96 10.1.20.48
1 3des-cbc hmac-shal-96 10.1.20.48
```

**With FIPS Mode disabled:**

```
Dell#show ip ssh
SSH server          : enabled.
SSH server version  : v1 and v2.
SSH server vrf      : default.
SSH server ciphers  : 3des-cbc,aes128-cbc,aes192-
cbc,aes256-cbc,aes128-ctr,aes192-ctr,aes256-ctr.
SSH server macs     : hmac-md5,hmac-md5-96,hmac-
shal,hmac-shal-96,hmac-sha2-256,hmac-sha2-256-96.
SSH server kex algorithms : diffie-hellman-group-exchange-
shal,diffie-hellman-group1-shal,diffie-hellman-group14-shal.
Password Authentication : enabled.
Hostbased Authentication : disabled.
RSA Authentication   : disabled.
  Vty      Encryption      HMAC      Remote IP
0 3des-cbc hmac-shal-96 10.1.20.48
1 3des-cbc hmac-shal-96 10.1.20.48
```

# ssh

Open an SSH connection specifying the hostname, username, port number, and version of the SSH client.

**Syntax** `ssh {hostname|ipv4 address|ipv6 address} [-c encryption cipher|-l username|-m HMAC alogorithm|-p port-number|-v {1|2}]`

## Parameters

<b>hostname</b>	(OPTIONAL) Enter the IP address or the hostname of the remote device.
<b>ipv4 address</b>	(OPTIONAL) Enter the IP address in dotted decimal format A.B.C.D.
<b>ipv6 addressprefix</b>	(OPTIONAL) Enter the IPv6 address in the x:x:x:x format then the prefix length in the /x format. The range is from /0 to /128

**NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

<b>-c encryption cipher</b>	Enter the following encryption cipher to use. (For v2 clients only.) <ul style="list-style-type: none"><li>• 3des-cbc: Force ssh to use 3des-cbc encryption cipher. FIPS mode is enabled or disabled:<ul style="list-style-type: none"><li>• 3des-cbc: Force ssh to use 3des-cbc encryption cipher.</li><li>• aes128-cbc: Force ssh to use the aes128-cbc encryption cipher.</li><li>• aes192-cbc: Force ssh to use the aes256-cbc encryption cipher.</li><li>• aes256-cbc: Force ssh to use the aes128-cbc encryption cipher.</li><li>• aes128-ctr: Force ssh to use the aes256-cbc encryption cipher.</li><li>• aes192-ctr: Force ssh to use the aes128-cbc encryption cipher.</li><li>• aes256-cbc: Force ssh to use the aes256-cbc encryption cipher.</li></ul></li></ul>
<b>-l username</b>	(OPTIONAL) Enter the keyword -l then the user name used in this SSH session. The default is the user name of the user associated with the terminal.
<b>-m HMAC algorithm</b>	Enter one of the following HMAC algorithms to use. (For v2 clients only.):

Without the FIPS mode enabled:

- `hmac-sha1`: Force ssh to use the hmac-sha1 HMAC algorithm.
- `hmac-sha1-96`: Force ssh to use the hmac-sha1-96 HMAC algorithm.
- `hmac-md5`: Force ssh to use the hmac-md5 HMAC algorithm.
- `hmac-md5-96`: Force ssh to use the hmac-md5-96 HMAC algorithm.

With the FIPS mode enabled:

- `hmac-md5`: Force ssh to use the hmac-md5 HMAC algorithm.
- `hmac-md5-96`: Force ssh to use the hmac-md5-96 HMAC algorithm.
- `hmac-sha1`: Force ssh to use the hmac-sha1 HMAC algorithm.
- `hmac-sha1-96`: Force ssh to use the hmac-sha1-96 HMAC algorithm.
- `hmac-sha2-256`: Force ssh to use the hmac-sha2-256 HMAC algorithm.
- `hmac-sha2-256-96`: Force ssh to use the hmac-sha2-256-96 HMAC algorithm.

**-p port-number**

(OPTIONAL) Enter the keyword `-p` then the port number. The range is 1 to 65535.

**-v {1|2}**

(OPTIONAL) Enter the keyword `-v` then the SSH version 1 or 2.

The default: The version from the protocol negotiation.

**NOTE:** If the FIPS mode is enabled, this option does not display in the output.

**Defaults**

As indicated above.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.1(0.0)	Introduced on the Z9000.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

**Related Commands**

<code>ip ssh server</code>	Configure an SSH server.
<code>show ip ssh client-public-keys</code>	Display the client-public keys.

**Usage Information**

Dell Networking OS supports both inbound and outbound SSH sessions using IPv4 or IPv6 addressing. Inbound SSH supports accessing the system through the management interface as well as through a physical Layer 3 interface.

**NOTE:** Some of the parameters in this command require licensing to access. For more information, contact your Dell Networking representative.

**Example**

**If FIPS mode is not enabled:**

```
Dell#ssh 10.10.10.10 ?
-c   Encryption cipher to use (for v2 clients only)
-l   User name option
-m   HMAC algorithm to use (for v2 clients only)
-p   SSH server port option (default 22)
-v   SSH protocol version
<cr>
Dell#ssh 10.10.10.10 -c ?
3des-cbc           Force ssh to use 3des-cbc encryption
cipher
aes128-cbc         Force ssh to use aes128-cbc encryption
cipher
aes192-cbc        Force ssh to use aes192-cbc encryption
cipher
aes256-cbc        Force ssh to use aes256-cbc encryption
cipher
aes128-ctr        Force ssh to use aes128-ctr encryption
cipher
aes192-ctr        Force ssh to use aes192-ctr encryption
cipher
aes256-ctr        Force ssh to use aes256-ctr encryption
cipher
Dell#ssh 10.10.10.10 -m ?
hmac-md5          Force ssh to use hmac-md5 HMAC algorithm
hmac-md5-96      Force ssh to use hmac-md5-96 HMAC algorithm
hmac-sha1         Force ssh to use hmac-sha1 HMAC algorithm
hmac-sha1-96     Force ssh to use hmac-sha1-96 HMAC algorithm
hmac-sha2-256    Force ssh to use hmac-sha2-256 HMAC algorithm
hmac-sha2-256-96 Force ssh to use hmac-sha2-256-96 HMAC
algorithm
```

**With FIPS mode enabled:**

```
Dell#ssh 10.10.10.10 ?
-c   Encryption cipher to use (for v2 clients only)
-l   User name option
-m   HMAC algorithm to use (for v2 clients only)
-p   SSH server port option (default 22)
```

```
<cr>
Dell#ssh 10.10.10.10 -c ?
3des-cbc          Force ssh to use 3des-cbc encryption cipher
aes128-cbc        Force ssh to use aes128-cbc encryption cipher
aes192-cbc        Force ssh to use aes192-cbc encryption cipher
aes256-cbc        Force ssh to use aes256-cbc encryption cipher
aes128-ctr        Force ssh to use aes128-ctr encryption cipher
aes192-ctr        Force ssh to use aes192-ctr encryption cipher
aes256-ctr        Force ssh to use aes256-ctr encryption cipher
Dell#ssh 10.10.10.10 -m ?
hmac-sha1         Force ssh to use hmac-sha1 HMAC algorithm
hmac-sha1-96      Force ssh to use hmac-sha1-96 HMAC algorithm
hmac-sha2-256     Force ssh to use hmac-sha2-256 HMAC algorithm
hmac-sha2-256-96 Force ssh to use hmac-sha2-256-96 HMAC
algorithm
```

# FIP Snooping

To enable the FCoE Transit feature and configure FIP snooping, use the following Dell Networking Operating System commands on the S4820T platform.

In a converged Ethernet network, a switch can operate as an intermediate Ethernet bridge to snoop on FIP packets during the login process on Fibre Channel over Ethernet (FCoE) forwarders (FCFs). Acting as a transit FIP snooping bridge, the switch uses dynamically created access control lists (ACLs) to permit only authorized FCoE traffic to transmit between an FCoE end-device and an FCF.

## clear fip-snooping database interface vlan

Clear FIP snooping information on a VLAN for a specified FCoE MAC address, ENode MAC address, or FCF MAC address, and remove the corresponding ACLs FIP snooping generates.

### S4820T

**Syntax**

```
clear fip-snooping database interface vlan {vlan-id} enode
{enode-mac-address} | fcf {fcf-mac-address} | session {session-
mac-address}
```

**Parameters**

<b><i>enode-mac-address</i></b>	Enter the ENode MAC address to be cleared of FIP snooping information.
<b><i>fcf-mac-address</i></b>	Enter the FCF MAC address to be cleared of FIP snooping information.
<b><i>session-mac-address</i></b>	Enter the MAC address for the session to be cleared of FIP snooping information.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the Z9500 and S6000-ON.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

## clear fip-snooping statistics

Clears the statistics on the FIP packets snooped on all VLANs, a specified VLAN, or a specified port interface.

### S4820T

#### Syntax

```
clear fip-snooping statistics [interface vlan vlan-id |
interface fortyGigEport-type port/slot | interface port-channel
port-channel-number]
```

#### Parameters

<b><i>vlan-id</i></b>	Enter the VLAN ID of the FIP packet statistics to be cleared.
<b><i>port-type port/slot</i></b>	Enter the port-type and slot number of the FIP packet statistics to be cleared.
<b><i>port-channelnumber</i></b>	Enter the port channel number of the FIP packet statistics to be cleared.

#### Command Modes

EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the Z9500 and S6000-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

# debug fip snooping

Enable debugging on FIP snooping.

## S4820T

**Syntax** `debug fip-snooping [all | acl | error | ifm | info | ipc | tx]`

<b>Parameters</b>	<b>all</b>	Enter the keyword <code>all</code> to enable debugging on all the options.
	<b>acl</b>	Enter the keyword <code>acl</code> for ACL-specific debugging.
	<b>error</b>	Enter the keyword <code>error</code> for error-specific debugging.
	<b>ifm</b>	Enter the keyword <code>ifm</code> for IFM-specific debugging.
	<b>info</b>	Enter the keyword <code>info</code> for information-specific debugging.
	<b>ipc</b>	Enter the keyword <code>ipc</code> for IPC-specific debugging.
	<b>tx</b>	Enter the keyword <code>tx</code> for packet transmit-specific debugging.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the Z9500 and S6000-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

# debug fip snooping rx

Enable debugging for FIP snooping receive-specific packets.

## S4820T

**Syntax** `debug fip-snooping rx packet-type [all | discovery | virtual-link-instantiation | virtual-link-maintenance | vlan-discovery] [interface]`

## Parameters

### **packet-type**

Enter the keyword `packet-type` and then the option type on which to enable debugging. The options are:

- `all` — Enter the keyword `all` to enable debugging on all the options.
- `discovery` — Enter the keyword `discovery` to enable debugging on FCF advertisements and ENode solicitation.
- `virtual-link-instantiation` — Enter the keywords `virtual-link-instantiation` to enable debugging on FLOGI, FDISC, and FLOGO packets.
- `virtual-link-maintenance` — Enter the keywords `virtual-link-maintenance` to enable debugging on FIP clear virtual link frames and keepalives.
- `vlan-discovery` — Enter the keywords `vlan-discovery` to enable debugging on VLAN requests and notifications.

### **interface**

Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.

## Command Modes

EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the Z9500 and S6000-ON.
9.2(0.2)	Introduced on the S4810 and S4820T. Added the receive parameters <code>packet-type</code> and <code>interfaces</code> and their options.

## feature fip-snooping

Enable FCoE transit and FIP snooping on a switch.

### S4820T

<b>Syntax</b>	<code>feature fip-snooping</code> To disable the FCoE transit feature, use the <code>no feature fip-snooping</code> command.
<b>Defaults</b>	Disabled
<b>Command Modes</b>	CONFIGURATION
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.7(0.0)	Introduced on the Z9500.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

## fip-snooping enable

Enable FIP snooping on all VLANs or on a specified VLAN.

### S4820T

<b>Syntax</b>	<code>fip-snooping enable</code> To disable the FIP snooping feature on all or a specified VLAN, use the <code>no fip-snooping enable</code> command.
<b>Defaults</b>	FIP snooping is disabled on all VLANs.
<b>Command Modes</b>	<ul style="list-style-type: none"><li>• CONFIGURATION</li><li>• VLAN INTERFACE</li></ul>

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the Z9500 and S6000-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

## Usage Information

The maximum number of FCFs supported per FIP snooping-enabled VLAN is four. The maximum number of FIP snooping sessions supported per ENode server is 16.

# fip-snooping fc-map

Configure the FC-MAP value FIP snooping uses on all VLANs.

## S4820T

### Syntax

```
fip-snooping fc-map fc-map-value
```

To return the configured FM-MAP value to the default value, use the `no fip-snooping fc-map` command.

### Parameters

***fc-map-value*** Enter the FC-MAP value FIP snooping uses. The range is from 0EFC00 to 0EFCFF.

### Defaults

**0x0EFC00**

### Command Modes

- CONFIGURATION
- VLAN INTERFACE

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the Z9500 and S6000-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

## fip-snooping max-sessions-per-enodemac

Configure the maximum session limit per ENode MAC address.

### S4820T

**Syntax** `fip-snooping max-sessions-per-enode-mac max-sessions-value`  
To return the configured maximum sessions to the default value, use the `no fip-snooping max-sessions-per-enode-mac` command.

**Parameters**

<b><i>max-sessions-value</i></b>	Enter the maximum number of sessions allowed per ENode MAC address. The range is from 1 to 64.
----------------------------------	--

**Defaults** **32**

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the Z9500 and S6000-ON.
9.2(0.2)	Introduced on the S4810 and S4820T.

## fip-snooping port-mode fcf

Configure the port for bridge-to-FCF links.

### S4820T

**Syntax** `fip-snooping port-mode fcf`  
To disable the bridge-to-FCF link on a port, use the `no fip-snooping port-mode fcf` command.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the Z9500 and S6000-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

**Usage  
Information**

The maximum number of FCFs supported per FIP snooping-enabled VLAN is four.

## fip-snooping port-mode fcoe-trusted

Configure the port for bridge-to-bridge links.

### S4820T

**Syntax**

```
fip-snooping port-mode fcoe-trusted
```

To remove the bridge-to-bridge link configuration from the port, use the `no fip-snooping port-mode fcoe-trusted` command.

**Command  
Modes**

INTERFACE

**Command  
History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	This command is deprecated.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.16.0	Introduced on MXL 10/40GbE Switch IO Module.

**Usage  
Information**

**NOTE:** This command is deprecated from the Dell Networking OS.

## show fip-snooping config

Display the FIP snooping status and configured FC-MAP values.

### S4820T

**Syntax** `show fip-snooping config`

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the Z9500 and S6000-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

### Example

```
Dell# show fip-snooping config
FIP Snooping Feature enabled Status: Enabled
FIP Snooping Global enabled Status: Enabled
Global FC-MAP Value: 0X0EFC00

FIP Snooping enabled VLANs
VLAN   Enabled   FC-MAP
----   -
100    TRUE      0X0EFC00
```

## show fip-snooping enode

Display information on the ENodes in FIP-snooped sessions, including the ENode interface and MAC address, FCF MAC address, VLAN ID and FC-ID.

### S4820T

**Syntax** `show fip-snooping enode [enode-mac-address]`

**Parameters**

<b><i>enode-mac-address</i></b>	Enter the MAC address of the ENodes to display.
---------------------------------	---

## Command Modes

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the Z9500 and S6000-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

## Usage Information

The following describes the `show fip-snooping enode` command shown in the following example.

Field	Description
ENode MAC	MAC address of the ENode.
ENode Interface	Slot/ port number of the interface connected to the ENode.
FCF MAC	MAC address of the FCF.
VLAN	VLAN ID number the session uses.
FC-ID	Fibre Channel session ID the FCF assigns.

## Example

```
Dell# show fip-snooping enode
Enode MAC           Enode Interface  FCF MAC           VLAN FC-ID
-----
d4:ae:52:1b:e3:cd Te 1/11          54:7f:ee:37:34:40 100
62:00:11
```

# show fip-snooping fcf

Display information on the FCFs in FIP-snooped sessions, including the FCF interface and MAC address, FCF interface, VLAN ID, FC-MAP value, FKA advertisement period, and number of ENodes connected.

## S4820T

### Syntax

```
show fip-snooping fcf [fcf-mac-address]
```

### Parameters

***fcf-mac-address*** Enter the MAC address of the FCF to display.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the Z9500 and S6000-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

**Usage Information**

The following describes the `show fip-snooping fcf` command shown in the following example.

Field	Description
FCF MAC	MAC address of the FCF.
FCF Interface	Slot/port number of the interface to which the FCF is connected.
VLAN	VLAN ID number the session uses.
FC-MAP	FC-Map value the FCF advertises.
ENode Interface	Slot/ number of the interface connected to the ENode.
FKA_ADV_PERIOD	Time (in milliseconds) during which FIP keep-alive advertisements transmit.
No of ENodes	Number of ENodes connected to the FCF.
FC-ID	Fibre Channel session ID the FCF assigns.

**Example**

```
Dell# show fip-snooping fcf
FCF MAC          FCF Interface  VLAN  FC-MAP  FKA_ADV_PERIOD  No. of
Enodes
-----
54:7f:ee:37:34:40 Po 22      100  0e:fc:00  4000
2
```

# show fip-snooping statistics

Display statistics on the FIP packets snooped on all interfaces, including VLANs, physical ports, and port channels.

## S4820T

### Syntax

```
show fip-snooping statistics [interface vlan vlan-id |  
interface port-type port/slot | interface port-channel port-  
channel-number]
```

### Parameters

<b><i>vlan-id</i></b>	Enter the VLAN ID of the FIP packet statistics displays.
<b><i>port-type port/slot</i></b>	Enter the port-type and slot number of the FIP packet statistics displays.
<b><i>port-channel-number</i></b>	Enter the port channel number of the FIP packet statistics displays.

### Command Modes

- EXEC
- EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the Z9500 and S6000-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

### Usage Information

The following describes the `show fip-snooping statistics` command shown in the following example.

Field	Description
<b>Number of VLAN Requests</b>	Number of FIP-snoop VLAN request frames received on the interface.
<b>Number of VLAN Notifications</b>	Number of FIP-snoop VLAN notification frames received on the interface.
<b>Number of Multicast Discovery Solicits</b>	Number of FIP-snoop multicast discovery solicit frames received on the interface.

<b>Field</b>	<b>Description</b>
<b>Number of Unicast Discovery Solicits</b>	Number of FIP-snoop unicast discovery solicit frames received on the interface.
<b>Number of FLOGI</b>	Number of FIP-snoop FLOGI request frames received on the interface.
<b>Number of FDISC</b>	Number of FIP-snoop FDISC request frames received on the interface.
<b>Number of FLOGO</b>	Number of FIP-snoop FLOGO frames received on the interface.
<b>Number of ENode Keep Alives</b>	Number of FIP-snoop ENode keep-alive frames received on the interface.
<b>Number of VN Port Keep Alives</b>	Number of FIP-snoop VN port (Virtual N-port) keep-alive frames received on the interface.
<b>Number of Multicast Discovery Advertisements</b>	Number of FIP-snoop multicast discovery advertisements received on the interface.
<b>Number of Unicast Discovery Advertisements</b>	Number of FIP-snoop unicast discovery advertisements received on the interface.
<b>Number of FLOGI Accepts</b>	Number of FIP FLOGI accept frames received on the interface.
<b>Number of FLOGI Rejects</b>	Number of FIP FLOGI reject frames received on the interface.
<b>Number of FDISC Accepts</b>	Number of FIP FDISC accept frames received on the interface.
<b>Number of FDISC Rejects</b>	Number of FIP FDISC reject frames received on the interface.
<b>Number of FLOGO Accepts</b>	Number of FIP FLOGO accept frames received on the interface.
<b>Number of FLOGO Rejects</b>	Number of FIP FLOGO reject frames received on the interface.
<b>Number of CVLs</b>	Number of FIP clear virtual link frames received on the interface.
<b>Number of FCF Discovery Timeouts</b>	Number of FCF discovery timeouts that occurred on the interface.
<b>Number of VN Port Session Timeouts</b>	Number of VN port session timeouts that occurred on the interface.

Field	Description
Number of Session failures due to Hardware Config	Number of session failures due to hardware configuration that occurred on the interface.

**Example**

```

Dell# show fip-snooping statistics interface vlan 100
Number of Vlan Requests           :0
Number of Vlan Notifications      :0
Number of Multicast Discovery Solicits :2
Number of Unicast Discovery Solicits :0
Number of FLOGI                   :2
Number of FDISC                    :16
Number of FLOGO                    :0
Number of Enode Keep Alive         :9021
Number of VN Port Keep Alive       :3349
Number of Multicast Discovery Advertisement :4437
Number of Unicast Discovery Advertisement :2
Number of FLOGI Accepts            :2
Number of FLOGI Rejects           :0
Number of FDISC Accepts            :16
Number of FDISC Rejects           :0
Number of FLOGO Accepts           :0
Number of FLOGO Rejects           :0
Number of CVL                      :0
Number of FCF Discovery Timeouts   :0
Number of VN Port Session Timeouts :0
Number of Session failures due to Hardware Config :0
Dell(conf)#

Dell# show fip-snooping statistics int tengigabitethernet 1/11
Number of Vlan Requests           :1
Number of Vlan Notifications      :0
Number of Multicast Discovery Solicits :1
Number of Unicast Discovery Solicits :0
Number of FLOGI                   :1
Number of FDISC                    :16
Number of FLOGO                    :0
Number of Enode Keep Alive         :4416
Number of VN Port Keep Alive       :3136
Number of Multicast Discovery Advertisement :0
Number of Unicast Discovery Advertisement :0
Number of FLOGI Accepts            :0

Number of VN Port Session Timeouts :0
Number of Session failures due to Hardware Config :0

```

## show fip-snooping system

Display information on the status of FIP snooping on the switch (enabled or disabled), including the number of FCoE VLANs, FCFs, ENodes, and currently active sessions.

### S4820T

**Syntax** show fip-snooping system

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the Z9500 and S6000-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

**Example**

```

Dell# show fip-snooping system
Global Mode : Enabled
FCOE VLAN List (Operational) : 1, 100
FCFs : 1
Enodes : 2
Sessions : 17

```

## show fip-snooping vlan

Display information on the FCoE VLANs on which FIP snooping is enabled.

### S4820T

**Syntax** `show fip-snooping vlan`

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the Z9500 and S6000-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

**Example**

```
Dell# show fip-snooping vlan
* = Default VLAN
VLAN FC-MAP      FCFs Enodes Sessions
----  -
*1    -          -     -     -
100   0X0EFC00  1     2     17
```

## show fips status

Display the FIPs status on the platform.

### S4820T

**Syntax** `show fips status`

**Defaults** none

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

<b>Version</b>	<b>Description</b>
9.7(0.0)	Introduced on the S6000-ON.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

# Force10 Resilient Ring Protocol (FRRP)

Force10 resilient ring protocol (FRRP) is supported on Dell Networking OS.

FRRP is a proprietary protocol for that offers fast convergence in a Layer 2 network without having to run the spanning tree protocol (STP). The resilient ring protocol is an efficient protocol that transmits a high-speed token across a ring to verify the link status. All the intelligence is contained in the master node with practically no intelligence required of the transit mode.

## Important Points to Remember

- FRRP is media- and speed-independent.
- FRRP is a Dell Networking proprietary protocol that does not interoperate with any other vendor.
- Spanning Tree must be disabled on both primary and secondary interfaces before Resilient Ring protocol is enabled.
- A VLAN configured as the control VLAN for a ring cannot be configured as a control or member VLAN for any other ring.
- Member VLANs across multiple rings are not supported in Master nodes.
- If multiple rings share one or more member VLANs, they cannot share any links between them.
- Each ring can have only one Master node; all others are Transit nodes.

## clear frrp

Clear the FRRP statistics counters.

### S4820T

<b>Syntax</b>	<code>clear frrp [ring-id]</code>	
<b>Parameters</b>	<b>ring-id</b>	(Optional) Enter the ring identification number. The range is from 1 to 255.
<b>Defaults</b>	none	
<b>Command Modes</b>	EXEC	

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series.
7.5.1.0	Introduced.

## Usage Information

Executing this command without the optional `ring-id` command clears the statistics counters on all the available rings. Dell Networking OS requires a command line confirmation before the command executes. This command clears the following counters:

- hello Rx and Tx counters
- Topology change Rx and Tx counters
- The number of state change counters

## Example

```
Dell#clear frrp
Clear frrp statistics counter on all ring [confirm] yes
Dell#clear frrp 4
Clear frrp statistics counter for ring 4 [confirm] yes
Dell#
```

## Related Commands

[show frrp](#) — displays the Resilient Ring Protocol configuration.

# debug frrp

Clear the FRRP statistics counters.

## S4820T

**Syntax**            `debug frrp {event | packet | detail} [ring-id] [count number]`

To disable debugging, use the `no debug frrp {event | packet | detail} {ring-id} [countnumber] command`.

#### Parameters

<b>event</b>	Enter the keyword <code>event</code> to display debug information related to ring protocol transitions.
<b>packet</b>	Enter the keyword <code>packet</code> to display brief debug information related to control packets.
<b>detail</b>	Enter the keyword <code>detail</code> to display detailed debug information related to the entire ring protocol packets.
<b>ring-id</b>	(Optional) Enter the ring identification number. The range is from 1 to 255.
<b>count number</b>	Enter the keyword <code>count</code> then the number of debug outputs. The range is from 1 to 65534.

#### Defaults

Disabled.

#### Command Modes

CONFIGURATION (conf-frfp)

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series.
7.4.1.0	Introduced.

#### Usage Information

Because the resilient ring protocol can potentially transmit 20 packets per interface, restrict debug information.

## description

Enter an identifying description of the ring.

### S4820T

**Syntax** `description Word`  
To remove the ring description, use the `no description [Word]` command.

**Parameters** **Word** Enter a description of the ring. Maximum: 255 characters.

**Defaults** none

**Command Modes** CONFIGURATION (conf-frp)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series.
7.4.1.0	Introduced.

## disable

Disable the resilient ring protocol.

### S4820T

**Syntax** `disable`  
To enable the Resilient Ring Protocol, use the `no disable` command.

<b>Defaults</b>	<b>Disabled</b>																
<b>Command Modes</b>	CONFIGURATION (conf-frp)																
<b>Command History</b>	<p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> <table border="0"> <thead> <tr> <th>Version</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>9.7(0.0)</td> <td>Introduced on the S6000–ON.</td> </tr> <tr> <td>9.0.2.0</td> <td>Introduced on the S6000.</td> </tr> <tr> <td>8.3.19.0</td> <td>Introduced on the S4820T.</td> </tr> <tr> <td>8.3.11.1</td> <td>Introduced on the Z9000.</td> </tr> <tr> <td>8.3.7.0</td> <td>Introduced on the S4810.</td> </tr> <tr> <td>8.2.1.0</td> <td>Introduced on the C-Series.</td> </tr> <tr> <td>7.4.1.0</td> <td>Introduced.</td> </tr> </tbody> </table>	Version	Description	9.7(0.0)	Introduced on the S6000–ON.	9.0.2.0	Introduced on the S6000.	8.3.19.0	Introduced on the S4820T.	8.3.11.1	Introduced on the Z9000.	8.3.7.0	Introduced on the S4810.	8.2.1.0	Introduced on the C-Series.	7.4.1.0	Introduced.

## interface

Configure the primary, secondary, and control-vlan interfaces.

### S4820T

**Syntax**

```
interface {primary interface secondary interface control-vlan
vlan-id}
```

To return to the default, use the `no interface {primary interface secondary interface control-vlan vlan-id}` command.

**Parameters**

<b>primary <i>interface</i></b>	<p>Enter the keyword <code>primary</code> to configure the primary interface then one of the following interfaces and slot/port information:</p> <ul style="list-style-type: none"> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>For a port channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li> </ul>
-------------------------------------	---

**secondary interface** Enter the keyword `secondary` to configure the secondary interface then one of the following interfaces and slot/port information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.

**control-vlan vlan-id** Enter the keyword `control-vlan` then the VLAN ID. The range is from 1 to 4094.

**Defaults** none

**Command Modes** CONFIGURATION (conf-frrp)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series.
7.4.1.0	Introduced.

**Usage Information** This command causes the Ring Manager to take ownership of the two ports after IFM validates the configuration. Ownership is relinquished for a port only when the interface does not play a part in any control VLAN, that is, the interface does not belong to any ring.

**Related Commands** [show frrp](#) — displays the Resilient Ring Protocol configuration information.

## member-vlan

Specify the member VLAN identification numbers.

### S4820T

**Syntax** `member-vlan {vlan-range}`  
To return to the default, use the `no member-vlan [vlan-range]` command.

**Parameters**

<b>vlan-range</b>	Enter the member VLANs using VLAN IDs (separated by commas), a range of VLAN IDs (separated by a hyphen), a single VLAN ID, or a combination. For example: VLAN IDs (comma-separated): 3, 4, 6. Range (hyphen-separated): 5-10. Combination: 3, 4, 5-10, 8.
-------------------	---

**Defaults** none

**Command Modes** CONFIGURATION (conf-frmp)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series.
7.4.1.0	Introduced.

## mode

Set the Master or Transit mode of the ring.

### S4820T

**Syntax** `mode {master | transit}`  
To reset the mode, use the `no mode {master | transit}` command.

<b>Parameters</b>	<b>master</b>	Enter the keyword <code>master</code> to set the Ring node to Master mode.
	<b>transit</b>	Enter the keyword <code>transit</code> to set the Ring node to Transit mode.

**Defaults**                    **Mode None**

**Command Modes**            CONFIGURATION (conf-frp)

**Command History**        This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

<b>Version</b>	<b>Description</b>
<b>9.7(0.0)</b>	Introduced on the S6000–ON.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.2.1.0</b>	Introduced on the C-Series.
<b>7.4.1.0</b>	Introduced.

## protocol frp

Enter the Resilient Ring Protocol and designate a ring identification.

### S4820T

**Syntax**                    `protocol frp {ring-id}`  
 To exit the ring protocol, use the `no protocol frp {ring-id}` command.

**Parameters**                **ring-id**                    Enter the ring identification number. The range is from 1 to 255.

**Defaults**                    none

**Command Modes**            CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series.
7.4.1.0	Introduced

## Usage Information

This command places you into the resilient ring protocol. After executing this command, the command line prompt changes to `conf-frrp`.

# show frrp

Display the resilient ring protocol configuration.

## S4820T

### Syntax

```
show frrp [ring-id [summary]] | [summary]
```

### Parameters

<b>ring-id</b>	Enter the ring identification number. The range is from 1 to 255
<b>summary</b>	(OPTIONAL) Enter the keyword <code>summary</code> to view just a summarized version of the Ring configuration.

### Defaults

none

### Command Modes

EXEC

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.

Version	Description
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series.
7.4.1.0	Introduced.

**Usage Information**

Executing this command without the optional `ring-id` command clears the statistics counters on all the available rings. Dell Networking OS requires a command line confirmation before the command executes. This command clears the following counters:

- hello Rx and Tx counters
- Topology change Rx and Tx counters
- The number of state change counters

**Usage Information**

Executing this command without the optional `ring-id` command clears the statistics counters on all the available rings. Dell Networking OS requires a command line confirmation before the command is executed. This command clears the following counters:

- hello Rx and Tx counters
- Topology change Rx and Tx counters
- The number of state change counters

**Example (Summary)**

```
Dell#show frrp summary
Ring-ID State Mode Ctrl_Vlan Member_Vlans
-----
2 UP Master 2 11-20, 25,27-30
31 UP Transit 31 40-41
50 Down Transit 50 32
Dell#
```

**Example (1)**

```
Dell#show frrp 1
Ring protocol 1 is in Master mode
Ring Protocol Interface:
Primary : TenGigabitEthernet 1/16 State: Forwarding
Secondary: Port-channel 100 State: Blocking
Control Vlan: 1
Ring protocol Timers: Hello-Interval 50 msec Dead-Interval 150 msec
Ring Master's MAC Address is 00:01:e8:13:a3:19
Topology Change Statistics: Tx:110 Rx:45
Hello Statistics: Tx:13028 Rx:12348
Number of state Changes: 34
Member Vlans: 1000-1009
Dell#
```

### Example (2 Summary)

```
Dell#show frrip 2 summary
Dell#show frrip 2 summary
Ring-ID State Mode Ctrl_Vlan Member_Vlans
-----
2 Up Master 2 11-20, 25, 27-30
Dell#
```

### Related Commands

[protocol frrip](#) – enters the resilient ring protocol and designate a ring identification.

## timer

Set the hello interval or dead interval for the Ring control packets.

### S4820T

#### Syntax

```
timer {hello-interval milliseconds}| {dead-interval milliseconds}
```

To remove the timer, use the `no timer {hello-interval [milliseconds]}| {dead-interval milliseconds}` command.

#### Parameters

##### **hello-interval** *milliseconds*

Enter the keyword `hello-interval` then the time, in milliseconds, to set the hello interval of the control packets. The milliseconds must be entered in increments of 50 millisecond; for example, 50, 100, 150, and so on. If an invalid value is entered, an error message is generated. The range is from 50 to 2000 ms. Default: **500 ms**.

##### **dead-interval** *milliseconds*

Enter the keyword `dead-interval` then the time, in milliseconds, to set the dead interval of the control packets. The range is from 50 to 6000 ms. Default: **1500 ms**.

**NOTE:** The configured dead interval must be at least three times the hello interval.

#### Defaults

- **500 ms** for `hello-interval milliseconds`
- **1500 ms** for `dead-intervalmilliseconds`

#### Command Modes

CONFIGURATION (conf-frrip)

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series.
7.4.1.0	Introduced.

**Usage  
Information**

The `hello interval` command is the interval at which ring frames are generated from the primary interface of the master node. The `dead interval` command is the time that elapses before a time-out occurs.

## GARP VLAN Registration (GVRP)

The Dell Networking operating system supports the basic GVRP commands on the Dell Networking OS. The generic attribute registration protocol (GARP) mechanism allows the configuration of a GARP participant to propagate through a network quickly. A GARP participant registers or de-registers its attributes with other participants by making or withdrawing declarations of attributes. At the same time, based on received declarations or withdrawals, GARP handles attributes of other participants.

GVRP enables a device to propagate local VLAN registration information to other participant devices and dynamically update the VLAN registration information from other devices. The registration information updates local databases regarding active VLAN members and through which port the VLANs can be reached.

GVRP ensures that all participants on a bridged LAN maintain the same VLAN registration information. The VLAN registration information propagated by GVRP includes both manually configured local static entries and dynamic entries from other devices.

GVRP participants have the following components:

- The GVRP application
- GARP information propagation (GIP)
- GARP information declaration (GID)

### Important Points to Remember

- GVRP is supported on Layer 2 ports only.
- All VLAN ports added by GVRP are tagged.
- GVRP is supported on untagged ports belonging to a default VLAN and tagged ports.
- GVRP cannot be enabled on untagged ports belonging to a non-default VLAN *unless* native VLAN is turned on.
- GVRP requires end stations with dynamic access NICs.
- Based on updates from GVRP-enabled devices, GVRP allows the system to dynamically create a port-based VLAN (unspecified) with a specific VLAN ID and a specific port.
- On a port-by-port basis, GVRP allows the system to learn about GVRP updates to an existing port-based VLAN with that VLAN ID and IEEE 802.1Q tagging.
- GVRP allows the system to send dynamic GVRP updates about your existing port-based VLAN.
- GVRP updates are not sent to any blocked spanning tree protocol (STP) ports. GVRP operates only on ports that are in the forwarding state.
- GVRP operates only on ports that are in the STP forwarding state. If you enable GVRP, a port that changes to the STP Forwarding state automatically begin to participate in GVRP. A port that changes to an STP state other than forwarding no longer participates in GVRP.

- VLANs created dynamically with GVRP exist only as long as a GVRP-enabled device is sending updates. If the devices no longer send updates, or GVRP is disabled, or the system is rebooted, all dynamic VLANs are removed.
- GVRP manages the active topology, not non-topological data such as VLAN protocols. If a local bridge must classify and analyze packets by VLAN protocols, manually configure protocol-based VLANs, and simply rely on GVRP for VLAN updates. But if the local bridge must know only how to reach a given VLAN, then GVRP provides all necessary information.
- The VLAN topologies that GVRP learns are treated differently from VLANs that are statically configured. The GVRP dynamic updates are not saved in NVRAM, while static updates are saved in NVRAM. When GVRP is disabled, the system deletes all VLAN interfaces that were learned through GVRP and leaves unchanged all VLANs that were manually configured.

## clear gvrp statistics

Clear GVRP statistics on an interface.

### S4820T

<b>Syntax</b>	<code>clear gvrp statistics interface <i>interface</i></code>	
<b>Parameters</b>	<b>interface</b> <i>interface</i>	<p>Enter the following keywords and slot/port or number information:</p> <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li> </ul>
<b>Defaults</b>	none	
<b>Command Modes</b>	EXEC	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .	

The following is a list of the Dell Networking OS version history for this command.

<b>Version</b>	<b>Description</b>
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.

Version	Description
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on C-Series, E-Series, and S-Series

**Related Commands** [show gvrp statistics](#) — displays the GVRP statistics.

## debug gvrp

Enable debugging on GVRP.

### S4820T

**Syntax** `debug gvrp {config | events | pdu}`  
 To disable debugging, use the `no debug gvrp {config | events | pdu}` command.

Parameters	
<b>config</b>	Enter the keyword <code>config</code> to enable debugging on the GVRP configuration.
<b>event</b>	Enter the keyword <code>event</code> to enable debugging on the JOIN/LEAVE events.
<b>pdu</b>	Enter the keyword <code>pdu</code> then one of the following Interface keywords and slot/port or number information: <ul style="list-style-type: none"> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>For a port channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li> </ul>

**Defaults** Disabled.

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on C-Series, E-Series, and S-Series

## disable

Globally disable GVRP.

### S4820T

**Syntax**                    `disable`  
To re-enable GVRP, use the `no disable` command.

**Defaults**                    Enabled.

**Command Modes**            CONFIGURATION-GVRP

**Command History**           This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on C-Series, E-Series, and S-Series

**Related Commands**           [gvrp enable](#) — enables GVRP on physical interfaces and LAGs.  
[protocol gvrp](#) — access GVRP protocol.

# garp timers

Set the intervals (in milliseconds) for sending GARP messages.

## S4820T

### Syntax

```
garp timers {join | leave | leave-all}
```

To return to the previous setting, use the `no garp timers {join | leave | leave-all}` command.

### Parameters

#### join

Enter the keyword `join` then the number of milliseconds to configure the join time. The range is from 100 to 147483647 milliseconds. The default is **200 milliseconds**.

**NOTE:** Designate the milliseconds in multiples of 100.

#### leave

Enter the keyword `leave` then the number of milliseconds to configure the leave time. The range is from 100 to 2147483647 milliseconds. The default is **600 milliseconds**.

**NOTE:** Designate the milliseconds in multiples of 100.

#### leave-all

Enter the keywords `leave-all` then the number of milliseconds to configure the leave-all time. The range is from 100 to 2147483647 milliseconds. The default is 1000 milliseconds.

**NOTE:** Designate the milliseconds in multiples of 100.

### Defaults

As above.

### Command Modes

CONFIGURATION-GVRP

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.

Version	Description
7.6.1.0	Introduced on C-Series, E-Series, and S-Series

### Usage Information

- **Join Timer** — `Join` messages announce the willingness to register some attributes with other participants. For reliability, each GARP application entity sends a `Join` message twice and uses a join timer to set the sending interval.
- **Leave Timer** — `Leave` announces the willingness to de-register with other participants. Together with `Join`, `Leave` messages help GARP participants complete attribute reregistration and de-registration. The leave timer starts after receipt of a leave message sent for de-registering some attribute information. If a `Join` message is *not* received before the `Leave` time expires, the GARP application entity removes the attribute information as requested.
- **Leave All Timer** — The `Leave All` timer starts when a GARP application entity starts. When this timer expires, the entity sends a `Leave-all` message so that other entities can reregister their attribute information. Then the `Leave-all` time begins again.

### Related Commands

[show garp timers](#) — displays the current GARP times.

## gvrp enable

Enable GVRP on physical interfaces and LAGs.

### S4820T

#### Syntax

`gvrp enable`  
To disable GVRP on the interface, use the `no gvrp enable` command.

#### Defaults

Disabled.

#### Command Modes

CONFIGURATION-INTERFACE

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.

Version	Description
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on C-Series, E-Series, and S-Series

**Related Commands**      [disable](#) — globally disables GVRP.

## gvrp registration

Configure the GVRP register type.

### S4820T

**Syntax**                    `gvrp registration {fixed | normal | forbidden}`  
 To return to the default, use the `gvrp register normal` command.

**Parameters**

<b>fixed</b>	Enter the keyword <code>fixed</code> then the VLAN range in a comma-separated VLAN ID set.
<b>normal</b>	Enter the keyword <code>normal</code> then the VLAN range in a comma-separated VLAN ID set. This setting is the default.
<b>forbidden</b>	Enter the keyword <code>forbidden</code> then the VLAN range in a comma-separated VLAN ID set.

**Defaults**                    **normal**

**Command Modes**            CONFIGURATION-INTERFACE

**Command History**            This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on C-Series, E-Series, and S-Series

## Usage Information

Fixed registration prevents an interface, configured using the command line, to belong to a VLAN (static configuration) from being unconfigured when it receives a `Leave` message. Therefore, Registration mode on that interface is fixed.

Normal registration is the default registration. The port's membership in the VLAN depends on GVRP. The interface becomes a member of a VLAN after learning about the VLAN through GVRP. If the VLAN is removed from the port that sends GVRP advertisements to this device, the port stops being a member of the VLAN.

To advertise or learn about VLANs through GVRP, use the `forbidden` command when you do not want the interface.

## Related Commands

[show gvrp](#) — displays the GVRP configuration including the registration.

# protocol gvrp

Access GVRP protocol — (config-gvrp)#.

## S4820T

**Syntax** `protocol gvrp`

**Defaults** Disabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on C-Series, E-Series, and S-Series

## Related Commands

[disable](#) — globally disables GVRP.

## show config

Display the global GVRP configuration.

### S4820T

**Syntax** `show config`

**Command Modes** CONFIGURATION-GVRP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on C-Series, E-Series, and S-Series

**Related Commands** [gvrp enable](#) — enables GVRP on physical interfaces and LAGs.  
[protocol gvrp](#) — accesses the GVRP protocol.

## show garp timers

Display the GARP timer settings for sending GARP messages.

### S4820T

**Syntax** `show garp timers`

**Defaults** none

**Command Modes**

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on C-Series, E-Series, and S-Series

## Example

```
Dell#show garp timers
GARP Timers      Value (milliseconds)
-----
Join Timer       200
Leave Timer       600
LeaveAll Timer    10000
Dell#
```

## Related Commands

[garp timers](#) — sets the intervals (in milliseconds) for sending GARP messages.

# show gvrp

Display the GVRP configuration.

## S4820T

### Syntax

```
show gvrp [brief | interface]
```

### Parameters

- |                  |   |
|------------------|---|
| <b>brief</b>     | (OPTIONAL) Enter the keyword <code>brief</code> to display a brief summary of the GVRP configuration.   |
| <b>interface</b> | (OPTIONAL) Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>For a port channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li></ul> |

**Defaults** none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000–ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on C-Series, E-Series, and S-Series

**Usage Information** If no ports are GVRP participants, the message output changes from `GVRP Participants running on <port_list>` to `GVRP Participants running on no ports`.

**Example**

```
R3#show gvrp brief
GVRP Feature is currently enabled.
Port                GVRP Status      Edge-Port
-----
Te 3/1              Disabled          No
Te 3/2              Enabled           No
Te 3/3              Disabled          No
Te 3/4              Disabled          No
Te 3/5              Disabled          No
Te 3/6              Disabled          No
Te 3/7              Disabled          No
Te 3/8              Disabled          No
R3#show gvrp brief
```

**Related Commands** [show gvrp statistics](#) — displays the GVRP statistics.

# show gvrp statistics

Display the GVRP configuration statistics.

## S4820T

<b>Syntax</b>	<code>show gvrp statistics {interface interface   summary}</code>											
<b>Parameters</b>	<b>interface</b> <b>interface</b>	(OPTIONAL) Enter the keyword <code>interface</code> then one of the interface keywords and slot/port or number information: <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li></ul>										
	<b>summary</b>	Enter the keyword <code>summary</code> to display just a summary of the GVRP statistics.										
<b>Defaults</b>	none											
<b>Command Modes</b>	<ul style="list-style-type: none"><li>• EXEC</li><li>• EXEC Privilege</li></ul>											
<b>Command History</b>	<p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> <table><thead><tr><th>Version</th><th>Description</th></tr></thead><tbody><tr><td>9.7(0.0)</td><td>Introduced on the S6000-ON.</td></tr><tr><td>9.0.2.0</td><td>Introduced on the S6000.</td></tr><tr><td>8.3.11.1</td><td>Introduced on the Z9000.</td></tr><tr><td>7.6.1.0</td><td>Introduced on C-Series, E-Series, and S-Series</td></tr></tbody></table>		Version	Description	9.7(0.0)	Introduced on the S6000-ON.	9.0.2.0	Introduced on the S6000.	8.3.11.1	Introduced on the Z9000.	7.6.1.0	Introduced on C-Series, E-Series, and S-Series
Version	Description											
9.7(0.0)	Introduced on the S6000-ON.											
9.0.2.0	Introduced on the S6000.											
8.3.11.1	Introduced on the Z9000.											
7.6.1.0	Introduced on C-Series, E-Series, and S-Series											
<b>Usage Information</b>	Invalid messages/attributes skipped can occur in the following cases: <ul style="list-style-type: none"><li>• The incoming GVRP PDU has an incorrect length.</li><li>• "End of PDU" was reached before the complete attribute could be parsed.</li><li>• The Attribute Type of the attribute that was being parsed was not the GVRP VID Attribute Type (0x01).</li><li>• The attribute that was being parsed had an invalid attribute length.</li><li>• The attribute that was being parsed had an invalid GARP event.</li><li>• The attribute that was being parsed had an invalid VLAN ID. The valid range is from 1 to 4095.</li></ul>											

A failed registration can occur for the following reasons:

- Join requests were received on a port that was blocked from learning dynamic VLANs (GVRP Blocking state).
- An entry for a new GVRP VLAN could not be created in the GVRP database.

#### Example

```
Dell#show gvrp statistics int tengigabitethernet 1/1

Join Empty Received: 0
Join In Received: 0
Empty Received: 0
LeaveIn Received: 0
Leave Empty Received: 0
Leave All Received: 40
Join Empty Transmitted: 156
Join In Transmitted: 0
Empty Transmitted: 0
Leave In Transmitted: 0
Leave Empty Transmitted: 0
Leave All Transmitted: 41
Invalid Messages/Attributes skipped: 0
Failed Registrations: 0
Dell#
```

#### Related Commands

[show gvrp](#) — displays the GVRP configuration.

## High Availability (HA)

High availability (HA) in the Dell Networking operating software is configuration synchronization to minimize recovery time in the event of a route processor module (RPM) failure. The feature is available on Dell Networking OS.

In general, a protocol is defined as “hitless” in the context of an RPM failure/failover and not failures of a line card, SFM, or power module. A protocol is defined as hitless if an RPM failover has no impact on the protocol.

You must specifically enable some protocols for HA. Some protocols are only hitless if related protocols are also enabled as hitless (for example, the `redundancy protocol` command).

### patch flash://RUNTIME\_PATCH\_DIR

Insert an In-Service Modular Hot-Fix patch.

#### S4820T

<b>Syntax</b>	<code>patch flash://RUNTIME_PATCH_DIR/patch-filename</code> To remove the patch, use the <code>no patch flash://RUNTIME_PATCH_DIR/patch-filename</code> command.
<b>Defaults</b>	none
<b>Command Modes</b>	CONFIGURATION
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .  The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.2.1.0	Introduced.

## Usage Information

The patch filename includes the Dell Networking OS version, the platform, the CPU, and the process it affects (`FTOS-platform-cpu-process-patchversion.rtp`). For example, a patch labeled "7.8.1.0-EH-rp2-l2mgr-1.rtp" identifies that this patch applies to Dell Networking OS version 7.8.1.0 — E-Series platform, for RP2, addressing the layer 2 management process, and this patch is the first version of this patch.

There is no need to reload or reboot the system when you insert the patch. The In-Service Modular patch replaces the existing process code. After installation is complete, the system executes the patch code as though it was always there.

## Related Commands

[show patch](#) — displays the system patches loaded with the `in-service modular hot fix` command.

# process restartable

Enable a process to be restarted. Restartability is subject to a maximum restart limit. This limit is defined as a configured number of restarts within a configured amount of time. On the software exception that exceeds the limit, the system reloads (for systems with a single RPM) or fails over (for systems with dual RPMs).

## S4820T

### Syntax

```
process restartable [process] [count number] [period minutes]
```

### Parameters

<b><i>process</i></b>	Configure a process to be restartable.
<b><i>count number</i></b>	Enter the number of times a process can restart within the configured period. The range is from 1 to 3. The default is <b>3</b> .
<b><i>period minutes</i></b>	Enter the amount of time within which the process can restart count times. The range is from 1 to 60 minutes. The default is <b>60 minutes</b> .

### Default

By default, a process can be restarted a maximum of three times within one hour. On the exception that exceeds this limit, the system reloads or fails over.

### Command Modes

CONFIGURATION

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
<b>8.3.19.0</b>	Introduced on the S4820T.

Version	Description
8.3.12.0	Introduced on the S4810.
8.4.1.0	Introduced on the E-Series.

Related Commands [show processes restartable](#)

## redundancy auto-failover-limit

Specify an auto-failover limit for RPMs. When a non-recoverable fatal error is detected, an automatic RPM failover occurs. This command does not affect user-initiated (manual) failovers.

### S4820T

**Syntax** `redundancy auto-failover-limit [count number [period minutes] | period minutes]`

To disable the auto-failover limit control, use the `no redundancy auto-failover-limit` command.

#### Parameters

- count *number*** Enter the number of times the RPMs can automatically failover within the period defined in the period parameter. The range is from 2 to 10. The default is **3**.
- period *minutes*** Enter a duration in which to allow a number of automatic failovers (limited to the number defined in the count parameter). The range is from 5 to 9000 minutes. The default is **60 minutes**.

#### Default

- Count: **3**
- Period: **60 minutes**

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.

Version	Description
8.1.1.0	Introduced on the E-Series ExaScale.
7.5.1.0	Introduced on the C-Series.
7.6.1.0	Introduced on the E-Series

### Usage Information

If you disable auto failover, enter the `redundancy auto-failover-limit` (without any parameters) to set auto failover to the default parameters (Count 3, Period 60 minutes). To view the redundancy status, use the `show redundancy` command.

When you change one or both of the optional parameters, Dell Networking OS checks that the interval between auto failovers is more than five (5) minutes. If the interval is less, Dell Networking OS returns a configuration error message.

## redundancy disable-auto-reboot

Prevent the system from auto-rebooting the failed module.

### S4820T

**Syntax** `redundancy disable-auto-reboot stack-unit [0-11 | members] [rpm | card number | all]`

To return to the default, use the `no redundancy disable-auto-reboot stack-unit rpm` command.

### Parameters

<b>rpm</b>	Enter the keyword <code>rpm</code> to disable auto-reboot of the failed RPM.
<b>stack-unit</b>	Enter the keyword <code>stack-unit</code> then the stack-unit ID number.

**Default** Disabled (that is, the failed module is automatically rebooted).

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.2(0.0)	Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.3.1.0	Added the <code>all</code> option.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the E-Series

**Usage Information**

Enabling this command keeps the failed RPM in the failed state. If there are two RPMs in the system, enabling this command prevents the failed RPM from becoming a working Standby RPM. If there is only one RPM in the system, the failed RPM does not recover and affects the system.

## redundancy force-failover

Force the secondary stack unit to become the primary stack unit. You can also use this command to upgrade the software on one stack unit from the other when the other has been loaded with the upgraded software.

### S4820T

**Syntax**

`redundancy force-failover stack-unit`

**Parameters**

**stack-unit** Enter the keyword `stack-unit` then the stack-unit ID number.

**Default**

Not configured.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.2(0.0)	Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
8.3.19.0	Introduced on the S4820T.

Version	Description
8.3.12.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.5.1.0	Introduced on the C-Series.
7.6.1.0	Introduced on the E-Series.

### Usage Information

To provide a hitless or warm upgrade, use this command. A hitless upgrade means that a software upgrade does not require a reboot of the line cards. A warm upgrade means that a software upgrade requires a reset of the line cards. A warm upgrade is possible for major releases and lower, while a hitless upgrade can only support patch releases.

## redundancy primary

Set an RPM as the primary RPM.

### S4820T

#### Syntax

```
redundancy primary [rpm0 | rpm1]
```

To delete a configuration, use the `no redundancy primary` command.

#### Parameters

<b>rpm0</b>	Enter the keyword <code>rpm0</code> to set the RPM in slot R0 as the primary RPM.
<b>rpm1</b>	Enter the keyword <code>rpm1</code> to set the RPM in slot R1 as the primary RPM.

#### Default

The RPM in slot R0 is the Primary RPM.

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.

Version	Description
7.5.1.0	Introduced on the C-Series.
7.6.1.0	Introduced on the E-Series.

## redundancy protocol

Enable hitless protocols.

### S4820T

<b>Syntax</b>	<code>redundancy protocol {lacp   xstp}</code> To disable a hitless protocol, use the <code>no redundancy protocol {lacp   xstp}</code> command.
<b>Parameters</b>	<p><b>lacp</b> Enter the keyword <code>lacp</code> to make LACP hitless.</p> <p><b>xstp</b> Enter the keyword <code>xstp</code> to invoke hitless STP (all STP modes – MSTP, PVST+, RSTP, and STP).</p>
<b>Default</b>	Disabled
<b>Command Modes</b>	CONFIGURATION
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Introduced on the C-Series.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the E-Series.

#### Related Commands

- [show lacp](#) — displays the lacp configuration.
- [show redundancy](#) — displays the current redundancy configuration.

## redundancy reset-counter

Reset failover counter and timestamp information displayed in the `show redundancy` command.

### S4820T

<b>Syntax</b>	<code>redundancy reset-counter</code>
<b>Default</b>	Not configured.
<b>Command Modes</b>	EXEC Privilege
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the E-Series.

## redundancy sfm standby

Place the SFM in an offline state.

### S4820T

<b>Syntax</b>	<code>redundancy sfm standby</code> To place the SFM in an online state, use the <code>no redundancy sfm standby</code> command.
<b>Default</b>	The SFM is online by default.
<b>Command Modes</b>	CONFIGURATION
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
7.5.1.0	Introduced on the C-Series.

### Usage Information

When you insert or remove a secondary RPM with logical SFM, the system must add or remove the backplane links to the switch fabric trunk. To avoid traffic disruption, use this command when you insert the secondary RPM. When you execute this command, the logical SFM on the standby RPM is immediately taken offline and the SFM state is set as "standby".

**NOTE:** This command could affect traffic when taking the secondary SFM offline.

### Example

```
Dell#show sfm all

Switch Fabric State: up

-- Switch Fabric Modules --
Slot Status
-----
0    active
1    active

Dell#configure
Dell(conf)#redundancy sfm standby
Taking secondary SFM offline...
!
Dell(conf)#do show sfm all

Switch Fabric State: up

-- Switch Fabric Modules --
Slot Status
-----
0    active
1    standby

Dell(conf)#no redundancy sfm
Taking secondary SFM online...
!
10Dell(conf)#do show sfm all

Switch Fabric State: up
-- Switch Fabric Modules --
Slot Status
-----
0    active
1    active
```

## redundancy synchronize

Manually synchronize data once between the Master and Stand-by stack units.

### S4820T

<b>Syntax</b>	<code>redundancy synchronize [full]</code>
<b>Parameters</b>	<b>full</b> Enter the keyword <code>full</code> to synchronize all data.
<b>Default</b>	Not configured.
<b>Command Modes</b>	EXEC Privilege
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.5.1.0	Introduced on the C-Series.
7.6.1.0	Introduced on the E-Series.

## show patch

Display the system patches loaded with the `In-Service Modular Hot Fix` command.

### S4820T

<b>Syntax</b>	<code>show patch</code>
<b>Command Modes</b>	EXEC
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.2.1.0	Introduced on the E-Series.

**Related Commands** [patch flash://RUNTIME\\_PATCH\\_DIR](#) – inserts an In-Service Modular Hot-Fix patch.

## show processes restartable

Display the processes and tasks configured for restartability.

### S4820T

**Syntax** `show processes restartable [history]`

**Parameters**

**history** Display the last time the restartable processes crashed.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.4.1.0	Introduced on the E-Series.

**Example**

```
Dell#sho processes restartable
-----
Process name State How many times restarted Timestamp last
restarted
-----
radius      enabled                0 [-]
tacplus     enabled                0 [-]
-----
Dell#show processes restartable history
-----
Process name Timestamp last crashed
-----
radius      [5/23/2001 10:11:47]
-----
```

## show redundancy

Display the current redundancy configuration.

### S4820T

**Syntax** `show redundancy`

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.2(0.0)	Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.5.1.0	Introduced on the C-Series.
7.6.1.0	Introduced on the E-Series.

**Usage Information** The following describes the `show redundancy` command shown in the following example.

Field	Description
RPM Status	Displays the following information: <ul style="list-style-type: none"><li>• Slot number of the RPM.</li><li>• Whether the RPM is Primary or Standby.</li><li>• The state of the RPM: Active, Standby, Booting, or Offline.</li><li>• Whether the link to the second RPM is up or down.</li></ul>

Field	Description
PEER RPM Status	Displays the state of the second RPM, if present
RPM Redundancy Configuration	<p>Displays the following information:</p> <ul style="list-style-type: none"> <li>• which RPM is the preferred Primary on next boot (the <code>redundancy primary</code> command)</li> <li>• the data sync method configured (the <code>redundancy synchronize</code> command)</li> <li>• the failover type (you cannot change this type; it is software-dependent). <b>Hot Failover</b> means that the running configuration and routing table are applied on secondary RPM. <b>Fast Failover</b> means that the running configuration is not applied on the secondary RPM until failover occurs, and the routing table on line cards is cleared during failover.</li> <li>• the status of auto booting the RPM (the <code>redundancy disable-auto-reboot</code> command)</li> <li>• the parameter for auto failover limit control (the <code>redundancy auto-failover-limit</code> command)</li> <li>•</li> </ul>
RPM Failover Record	<p>Displays the following information:</p> <ul style="list-style-type: none"> <li>• RPM failover counter (to reset the counter, use the <code>redundancy reset-counter</code> command)</li> <li>• the time and date of the last RPM failover</li> <li>• the reason for the last RPM failover</li> </ul>
Last Data Sync Record	<p>Displays the data sync information and the timestamp for the data sync:</p> <ul style="list-style-type: none"> <li>• Start-up Config is the contents of the startup-config file.</li> <li>• Line Card Config is the line card types configured and interfaces on those line cards.</li> <li>• Runtime Event Log is the contents of the Event log.</li> <li>• Running Config is the current running-config.</li> </ul> <p>This field only appears when you enter the command from the Primary RPM.</p>

**Example (S4820T)**

```

Dell#show redundancy
-- Stack-unit Status --
-----

## ICMP Message Types

This chapter lists and describes the possible ICMP message type resulting from a ping. The first three columns list the possible symbol or type/code. For example, you would receive a ! or 03 as an echo reply from your ping.

### ICMP Messages and Their Definitions.

Symbol	Type	Code	Description	Query	Error
.			Timeout (no reply)		
!	0	3	echo reply	.	
U	3		destination unreachable:		
		0	network unreachable		.
		1	host unreachable		.
		2	protocol unreachable		.
		3	port unreachable		.
		4	fragmentation needed but don't fragment bit set		.
		5	source route failed		.
		6	destination network unknown		.
		7	destination host unknown		.
		8	source host isolated (obsolete)		.
		9	destination network administratively prohibited		.
		10	destination host administratively prohibited		.
		11	network unreachable for TOS		.
		12	host unreachable for TOS		.
		13	communication administratively prohibited by filtering		.
		14	host precedence violation		.
		15	precedence cutoff in effect		.
C	4	0	source quench		.
	5		redirect		.

Symbol	Type	Code	Description	Query	Error
		0	redirect for network		.
		1	redirect for host		.
		2	redirect for type-of-service and network		.
		3	redirect for type-of-service and host		.
	8	0	echo request	.	
	9	0	router advertisement	.	
	10	0	router solicitation	.	
&	11		time exceeded:		
		0	time-to-live equals 0 during transit		.
		1	time-to-live equals 0 during reassembly		.
	12		parameter problem:		
		1	IP header bad (catchall error)		.
		2	required option missing		.
	13	0	timestamp request	.	
	14	0	timestamp reply	.	
	15	0	information request (obsolete)	.	
	16	0	information reply (obsolete)	.	
	17	0	address mask request	.	
	18	0	address mask reply	.	

# Internet Group Management Protocol (IGMP)

The IGMP commands are supported by the Dell Networking operating software on the Dell Networking OS.

This chapter contains the following sections:

- [IGMP Commands](#)
- [IGMP Snooping Commands](#)

## IGMP Commands

Dell Networking OS supports IGMPv1/v2/v3 and is compliant with RFC-3376.

### Important Points to Remember

- Dell Networking OS supports protocol-independent multicast-sparse (PIM-SM) and protocol-independent source-specific multicast (PIM-SSM) include and exclude modes.
- IGMPv2 is the default version of IGMP on interfaces. You can configure IGMPv3 on interfaces. It is backward compatible with IGMPv2.
- The maximum number of interfaces supported 95.
- There is no hard limit on the maximum number of groups supported.
- IGMPv3 router interoperability with IGMPv2 and IGMPv1 routers on the same subnet is not supported.
- An administrative command (`ip igmp version`) is added to manually set the IGMP version.
- All commands previously used for IGMPv2 are compatible with IGMPv3.

### clear ip igmp groups

Clear entries from the group cache table.

#### S4820T

**Syntax** `clear ip igmp [vrf vrf-name] groups [group-address | interface]`

**Parameters**

<b>vrf vrf-name</b>	(OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to configure this setting on that VRF.
---------------------	--

**NOTE:** Applies to specific VRF if input is provided, else applies to default VRF.

**group-address** (OPTIONAL) Enter the IP multicast group address in dotted decimal format.

**interface**  
**interface** Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Command Modes**

EXEC

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Added support for VRF. Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

**E-Series legacy command**

## debug ip igmp

Enable debugging of IGMP packets.

### S4820T

**Syntax** `debug ip igmp [vrf vrf-name] [group address | interface]`

- To disable IGMP debugging, use the `no debug ip igmp [vrf vrf-name] [group address | interface]` command.
- To disable all debugging, use the `undebug all` command.

## Parameters

**vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to enable debugging of IGMP packets corresponding to that VRF.

**NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

**group-address** (OPTIONAL) Enter the IP multicast group address in dotted decimal format.

**interface interface** Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.

## Defaults

Disabled.

## Command Modes

EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Added support for VRF. Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

**E-Series legacy command**

**Usage Information** IGMP commands accept *only* non-VLAN interfaces — specifying VLAN does not yield results. This command displays packets for IGMP and IGMP snooping.

## ip igmp access-group

To specify access control for packets, use this feature.

### S4820T

**Syntax** `ip igmp access-group access-list`  
To remove the feature, use the `no ip igmp access-group access-list` command.

**Parameters** ***access-list*** Enter the name of the extended ACL (16 characters maximum).

**Defaults** Not configured

**Command Modes** INTERFACE (conf-if-*interface-slot/port*)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the C-Series and S-Series.
7.6.1.0	Introduced on E-Series.

**Usage Information** The access list accepted is an extended ACL. To block IGMP reports from hosts, on a per-interface basis based on the group address and source address that you specify in the access list, use this feature.

## ip igmp group-join-limit

To limit the number of IGMP groups that can be joined in a second, use this feature.

### Z9500

<b>Syntax</b>	<code>ip igmp group-join-limit <i>number</i></code>
<b>Parameters</b>	<b><i>number</i></b> Enter the number of IGMP groups permitted to join in a second. The range is from 1 to 10000.
<b>Defaults</b>	none
<b>Command Modes</b>	CONFIGURATION ( <i>conf-if-interface-slot/port</i> )
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.0)	Introduced on the Z9500.
9.2(0.0)	Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the C-Series and S-Series.
7.6.1.0	Introduced on the E-Series.

## ip igmp immediate-leave

Enable IGMP immediate leave.

### S4820T

<b>Syntax</b>	<code>ip igmp immediate-leave [<i>group-list prefix-list-name</i>]</code> To disable <code>ip igmp immediate-leave</code> , use the <code>no ip igmp immediate-leave</code> command.
---------------	---

<b>Parameters</b>	<b>group-list</b> <b>prefix-list-</b> <b>name</b>	Enter the keywords <code>group-list</code> then a string up to 16 characters long of the <code>prefix-list-name</code> .
<b>Defaults</b>	Not configured.	
<b>Command Modes</b>	INTERFACE	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .	
	The following is a list of the Dell Networking OS version history for this command.	
	<b>Version</b>	<b>Description</b>
	9.7(0.0)	Introduced on the S6000-ON.
	9.0.2.0	Introduced on the S6000.
	8.3.19.0	Introduced on the S4820T.
	8.3.11.1	Introduced on the Z9000.
	8.3.7.0	Introduced on the S4810.
	7.8.1.0	Introduced on the S-Series.
	7.7.1.0	Introduced on the C-Series.
	<b>E-Series legacy command</b>	
<b>Usage Information</b>	Querier normally sends some group-specific queries when a <code>leave</code> message is received for a group prior to deleting a group from the membership database. There may be situations when you require immediate deletion of a group from the membership database. This command provides a way to achieve the immediate deletion. In addition, this command provides a way to enable <code>immediate-leave processing</code> for specified groups.	

## ip igmp last-member-query-interval

Change the last member query interval, which is the Max Response Time inserted into Group-Specific Queries sent in response to Leave Group messages. This interval is also the interval between Group-Specific Query messages.

### S4820T

<b>Syntax</b>	<code>ip igmp last-member-query-interval milliseconds</code>
	To return to the default value, use the <code>no ip igmp last-member-query-interval</code> command.

**Parameters**                      *milliseconds*                      Enter the number of milliseconds as the interval. For IGMP version 2, the range is from 100 to 25599. For IGMP version 3, the range is from 100 to 65535. The default value is **1000 milliseconds**.

**Defaults**                              **1000 milliseconds**

**Command Modes**                      INTERFACE

**Command History**                      This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	For IGMP version 2, the Interval range is from 100 to 25599. Introduced on the S6000-ON.
9.2(0.0)	Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
E-Series legacy command	

## ip igmp query-interval

Change the transmission frequency of IGMP general queries the Querier sends.

### S4820T

**Syntax**                              `ip igmp query-interval seconds`  
To return to the default values, use the `no ip igmp query-interval` command.

**Parameters**                              *seconds*                              Enter the number of seconds between queries sent out. The range is from 1 to 18000. The default is **60 seconds**.

**Defaults**                              **60 seconds**

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Maximum range of the Hello interval value is changed to 18000. Introduced on the S6000-ON.
9.5(0.0)	Introduced on the Z9500.
9.2(0.0)	Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.6.1.0	Introduced on the S-Series in Interface VLAN mode only to enable the system to act as an IGMP Proxy Querier.
7.5.1.0	Introduced on the C-Series in Interface VLAN mode only to enable the system to act as an IGMP Proxy Querier.
<b>E-Series legacy command.</b>	

**Usage Information** If you have configured the hello interval value to be greater than 18000, you must first reset that value to be less than or equal to 18000 before upload. Otherwise, the command execution fails during bootup and the hello interval value is set to the default value.

## ip igmp query-max-resp-time

Set the maximum query response time advertised in general queries.

 **NOTE:** The IGMP query-max-resp-time value must be less than the IGMP query-interval value.

**Syntax** `ip igmp query-max-resp-time seconds`  
To return to the default values, use the `no ip igmp query-max-resp-time` command.

**Parameters**                      *seconds*                      Enter the number of seconds for the maximum response time. The range is from 1 to 25. The default is **10 seconds**.

**Defaults**                      **10 seconds**

**Command Modes**                      INTERFACE

**Command History**                      This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

<b>Version</b>	<b>Description</b>
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.0)	Introduced on the Z9500.
9.2(0.0)	Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.6.1.0	Introduced on the S-Series in Interface VLAN mode only to enable the system to act as an IGMP Proxy Querier.
7.5.1.0	Introduced on the C-Series in Interface VLAN mode only to enable the system to act as an IGMP Proxy Querier.
<b>E-Series legacy command.</b>	

## **ip igmp ssm-map**

To translate (\*,G) memberships to (S,G) memberships, use a statically configured list.

### **S4820T**

**Syntax**                      `ip igmp [vrf vrf-name] ssm-map std-access-list source-address`  
Undo this configuration, that is, remove SSM map (S,G) states and replace them with (\*,G) state, use the `ip igmp [vrf vrf-name] ssm-map std-access-list source-address` command.

## Parameters

**vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.

**NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

**std-access-list** Specify the standard IP access list that contains the mapping rules for multicast groups.

**source-address** Specify the multicast source address to which the groups are mapped.

## Command Modes

CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Added support for VRF and Introduced on the S6000-ON.
9.5(0.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the C-Series and S-Series.
7.7.1.0	Introduced on the E-Series.

## Usage Information

Mapping applies to both v1 and v2 IGMP joins; any updates to the ACL are reflected in the IGMP groups. You may not use extended access lists with this command. When you configure a static SSM map and the router cannot find any matching access lists, the router continues to accept (\*,G) groups.

## Related Commands

[ip access-list standard](#) — creates a standard access list to filter based on IP address.

## ip igmp version

Manually set the version of the router to IGMPv2 or IGMPv3.

### S4820T

**Syntax** `ip igmp version {2 | 3}`

<b>Parameters</b>	2	Enter the number 2 to set the IGMP version number to IGMPv2.
	3	Enter the number 3 to set the IGMP version number to IGMPv3.
<b>Defaults</b>	2 (that is, IGMPv2)	
<b>Command Modes</b>	INTERFACE	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .	

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Changed the default IGMP from version 2 to version 3. Introduced on the S6000-ON
9.5(0.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
9.2(0.0)	Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the S-Series.
7.7.1.0	Introduced on the C-Series.
7.5.1.0	Introduced on the E-Series.

## show ip igmp groups

View the IGMP groups.

### S4820T

**Syntax** `show ip igmp [vrf vrf-name] groups [group-address [detail] | detail | interface [group-address [detail]]]`

<b>Parameters</b>	<b>vrf vrf-name</b>	(OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to configure this setting on that VRF.
	<b>group-address</b>	(OPTIONAL) Enter the group address in dotted decimal format to view information on that group only.

- interface** (OPTIONAL) Enter the interface type and slot/port information:
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**detail** (OPTIONAL) Enter the keyword `detail` to display the IGMPv3 source information.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Added support for VRF. Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series and C-Series.
7.5.1.0	Expanded to support the <code>detail</code> option.

**E-Series legacy command.**

**Usage Information**

This command displays the IGMP database, including configured entries for either all groups on all interfaces, all groups on specific interfaces, or specific groups on specific interfaces.

The following describes the `show ip igmp groups` command shown in the following example.

Field	Description
Group Address	Lists the multicast address for the IGMP group.
Interface	Lists the interface type, slot and port number.
Mode	Displays the IGMP version used.
Uptime	Displays the amount of time the group has been operational.
Expires	Displays the amount of time until the entry expires.
Last Reporter	Displays the IP address of the last host to be a member of the IGMP group.

#### Example

```
Dell#show ip igmp groups
Total Number of Groups: 5
IGMP Connected Group Membership
Group Address Interface Uptime Expires
225.0.0.0 Vlan 100 00:00:05 00:02:04
225.0.0.1 Vlan 100 00:00:05 00:02:04
225.0.0.2 Vlan 100 00:00:05 00:02:04
225.0.0.3 Vlan 100 00:00:05 00:02:04
225.0.0.4 Vlan 100 00:00:05 00:02:04
```

#### Example (VLT)

**NOTE:** The asterisk (\*) after the port channel number (Po 2) highlighted in the following example indicates the port channel is VLT, that the local VLT port channel is down and the remote VLT port is up.

```
Dell#show ip igmp groups
Total Number of Groups: 5
IGMP Connected Group Membership
Group Address Interface Mode Uptime Expires Last Reporter
225.0.0.0 Vlan 100 IGMPv2 00:00:05 00:02:04 3.0.0.51
225.0.0.1 Vlan 100 IGMPv2 00:00:05 00:02:04 3.0.0.51
225.0.0.2 Vlan 100 IGMPv2 00:00:05 00:02:04 3.0.0.51
225.0.0.3 Vlan 100 IGMPv2 00:00:05 00:02:04 3.0.0.51
225.0.0.4 Vlan 100 IGMPv2 00:00:05 00:02:04 3.0.0.51
```

#### Example (Details)

```
Dell#show ip igmp group details
Interface Vlan 20
Group 232.1.1.5
Uptime 00:11:22
Expires Never
Router mode INCLUDE
Last reporter 35.0.0.2
Group source list
Source address Expires
65.0.0.1 00:01:22
```

65.0.0.2	00:01:22
65.0.0.3	00:01:22
65.0.0.4	00:01:22
65.0.0.5	00:01:22

## show ip igmp interface

View information on the interfaces participating in IGMP.

### S4820T

**Syntax** `show ip igmp [vrf vrf-name] interface [interface]`

**Parameters**

<b>vrf vrf-name</b>	(OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to view IGMP interfaces associated with that VRF.
<b>interface</b>	(OPTIONAL) Enter the interface type and slot/port information: <ul style="list-style-type: none"> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li> <li>For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li> <li>For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> </ul>

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Added support for VRF. Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.

Version	Description
7.5.1.0	Introduced on the C-Series.

**E-Series legacy command.**

### Usage Information

IGMP commands accept *only* non-VLAN interfaces — specifying VLAN does not yield results.

The `show ip igmp interface` command does not display information corresponding to the loop-back interfaces.

### Example

```
Dell#show ip igmp interface
TenGigabitEthernet 1/1 is down, line protocol is down
  Internet protocol processing disabled
TenGigabitEthernet 1/5 is down, line protocol is down
  Internet protocol processing disabled
TenGigabitEthernet 1/6 is down, line protocol is down
  Internet protocol processing disabled
TenGigabitEthernet 1/7 is up, line protocol is down
  Internet protocol processing disabled
Vlan 20
  Inbound IGMP access group is not set
  Internet address is 35.0.0.1/24
  IGMP is enabled on interface
  IGMP query interval is 60 seconds
  IGMP querier timeout is 125 seconds
  IGMP max query response time is 10 seconds
  IGMP last member query response interval is 1000 ms
  IGMP immediate-leave is enabled for all groups
  IGMP activity: 0 joins
  IGMP querying router is 35.0.0.1 (this system)
  IGMP version is 2
```

### Example (VRF)

```
Dell#show ip igmp vrf BLUE interface
TenGigabitEthernet 1/20
  Inbound IGMP access group is not set
  Internet address is 50.10.4.1/24
  IGMP is up on the interface
  IGMP query interval is 60 seconds
  IGMP querier timeout is 0 seconds
  IGMP max query response time is 10 seconds
  IGMP last member query response interval is 1000 ms
  IGMP immediate-leave is disabled
  IGMP activity: 0 joins
  IGMP querying router is 50.10.4.1 (this system)
  IGMP version is 3
Vlan 4007
  Inbound IGMP access group is not set
  Internet address is 50.30.124.4/24
  IGMP is up on the interface
  IGMP query interval is 60 seconds
  IGMP querier timeout is 83 seconds
  IGMP max query response time is 10 seconds
  IGMP last member query response interval is 1000 ms
  IGMP immediate-leave is disabled
  IGMP activity: 0 joins
  IGMP querying router is 50.30.124.1
```

```
IGMP version is 3
Dell#
```

## show ip igmp ssm-map

Display is a list of groups that are currently in the IGMP group table and contain SSM mapped sources.

### S4820T

<b>Syntax</b>	<code>show ip igmp [vrf vrf-name] ssm-map [group]</code>
<b>Parameters</b>	
<b>vrf vrf-name</b>	(OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to configure this setting on that VRF.
	 <b>NOTE:</b> Applies to specific VRF if input is provided, else applies to Default VRF.
<b>group</b>	(OPTIONAL) Enter the multicast group address in the form A.B.C.D to display the list of sources to which this group is mapped.
<b>Command Modes</b>	<ul style="list-style-type: none"><li>EXEC</li><li>EXEC Privilege</li></ul>

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Added support for VRF. Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.8.1.0	Introduced on the C-Series and S-Series.
7.7.1.0	Introduced on the E-Series.

### Example

```
Dell#show ip igmp ssm-map
Interface          Vlan 20
Group              232.1.1.5
Uptime             00:11:22
Expires            Never
Router mode        INCLUDE
Last reporter      35.0.0.2
Group source list
Source address     Expires
65.0.0.1           00:01:22
```

65.0.0.2	00:01:22
65.0.0.3	00:01:22
65.0.0.4	00:01:22
65.0.0.5	00:01:22

**Related Commands**      [ip igmp ssm-map](#) — uses a statically configured list to translate (\*,G) memberships to (S,G) memberships.

## IGMP Snooping Commands

Dell Networking OS supports IGMP Snooping version 2 and 3 on all Dell Networking systems.

### Important Points to Remember for IGMP Snooping

- Dell Networking OS supports version 1, version 2, and version 3 hosts.
- Dell Networking OS IGMP snooping implementation is based on IP multicast address (not based on Layer 2 multicast mac address) and the IGMP snooping entries are in Layer 3 flow table not in Layer 2 forwarding information base (FIB).
- Dell Networking OS IGMP snooping implementation is based on draft-ietf-magma-snoop-10.
- Dell Networking OS supports IGMP snooping on JUMBO-enabled cards.
- IGMP snooping is not enabled by default on the switch.
- A maximum of 1800 groups and 600 VLAN are supported.
- IGMP snooping is not supported on a default VLAN interface.
- IGMP snooping is not supported over VLAN-Stack-enabled VLAN interfaces (you must disable IGMP snooping on a VLAN interface before configuring VLAN-Stack-related commands).
- IGMP snooping does not react to Layer 2 topology changes triggered by spanning tree protocol (STP).
- IGMP snooping reacts to Layer 2 topology changes multiple spanning tree protocol (MSTP) triggers by sending a general query on the interface that comes in the FWD state.

### Important Points to Remember for IGMP Querier

- The IGMP snooping Querier supports version 2.
- You must configure an IP address to the VLAN interface for IGMP snooping Querier to begin. The IGMP snooping Querier disables itself when a VLAN IP address is cleared, and then it restarts itself when an IP address is reassigned to the VLAN interface.
- When enabled, IGMP snooping Querier does not start if there is a statically configured multicast router interface in the VLAN.
- When enabled, IGMP snooping Querier starts after one query interval in case no IGMP general query (with IP SA lower than its VLAN IP address) is received on any of its VLAN members.
- When enabled, IGMP snooping Querier periodically sends general queries with an IP source address of the VLAN interface. If it receives a general query on any of its VLAN member, it checks the IP source address of the incoming frame.

If the IP SA in the incoming IGMP general query frame is lower than the IP address of the VLAN interface, the switch disables its IGMP snooping Querier functionality.

If the IP SA of the incoming IGMP general query is higher than the VLAN IP address, the switch continues to work as an IGMP snooping Querier.

## clear ip igmp snooping groups

Clear snooping entries from the group cache table.

### S4820T

<b>Syntax</b>	<code>clear ip igmp snooping groups [group-address interface   interface]</code>				
<b>Parameters</b>	<table><tr><td><b>group-address</b></td><td>(OPTIONAL) Enter the IP multicast group address in dotted decimal format.</td></tr><tr><td><b>interface</b> <b>interface</b></td><td>Enter the following keywords and slot/port or number information:<ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li></ul></td></tr></table>	<b>group-address</b>	(OPTIONAL) Enter the IP multicast group address in dotted decimal format.	<b>interface</b> <b>interface</b>	Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li></ul>
<b>group-address</b>	(OPTIONAL) Enter the IP multicast group address in dotted decimal format.				
<b>interface</b> <b>interface</b>	Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li></ul>				
<b>Command Modes</b>	EXEC				
<b>Command History</b>	<p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> <table><thead><tr><th>Version</th><th>Description</th></tr></thead><tbody><tr><td>9.7(0.0)</td><td>Introduced on S-Series and Z-Series.</td></tr></tbody></table>	Version	Description	9.7(0.0)	Introduced on S-Series and Z-Series.
Version	Description				
9.7(0.0)	Introduced on S-Series and Z-Series.				
<b>Usage Information</b>	IGMP commands accept only non-VLAN interfaces — specifying VLAN does not yield results.				

## debug ip igmp snooping

Enable debugging of IGMP snooping packets on interfaces and groups.

### S4820T

<b>Syntax</b>	<code>debug ip igmp snooping [group address   interface]</code> <ul style="list-style-type: none"><li>• To disable debugging of IGMP snooping, use the <code>no debug ip igmp snooping [group address   interface]</code> command.</li><li>• To disable all debugging, use the <code>undebug all</code> command.</li></ul>
---------------	--

<b>Parameters</b>	<p><b>snooping</b> Enter the keyword <code>snooping</code> to enable debugging of IGMP snooping.</p> <p><b>group-address</b> (OPTIONAL) Enter the IP multicast group address in dotted decimal format.</p> <p><b>interface interface</b> Enter the following keywords and slot/port or number information:</p> <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li> </ul>				
<b>Defaults</b>	Disabled.				
<b>Command Modes</b>	EXEC Privilege				
<b>Command History</b>	<p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> <table border="0"> <thead> <tr> <th style="text-align: left;">Version</th> <th style="text-align: left;">Description</th> </tr> </thead> <tbody> <tr> <td><b>9.7(0.0)</b></td> <td>Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, Z9000, and Z9500.</td> </tr> </tbody> </table>	Version	Description	<b>9.7(0.0)</b>	Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, Z9000, and Z9500.
Version	Description				
<b>9.7(0.0)</b>	Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, Z9000, and Z9500.				
<b>Usage Information</b>	IGMP commands accept <i>only</i> non-VLAN interfaces — specifying VLAN does not yield results. This command displays packets for IGMP and IGMP snooping.				

## ip igmp snooping enable

Enable IGMP snooping on all or a single VLAN. This command is the master on/off switch to enable IGMP snooping.

<b>Syntax</b>	<pre>ip igmp snooping enable</pre> <p>To disable IGMP snooping, use the <code>no ip igmp snooping enable</code> command.</p>
<b>Defaults</b>	Disabled.
<b>Command Modes</b>	<ul style="list-style-type: none"> <li>• CONFIGURATION</li> <li>• INTERFACE VLAN</li> </ul>
<b>Command History</b>	<p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p>

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.0)	Introduced on the Z9500.
9.2(0.0)	Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

#### Usage Information

To enable IGMP snooping, enter this command. When you enable this command from CONFIGURATION mode, IGMP snooping enables on all VLAN interfaces (except the default VLAN).

**NOTE:** Execute the `no shutdown` command on the VLAN interface for IGMP Snooping to function.

## ip igmp snooping fast-leave

Enable IGMP snooping fast-leave for this VLAN.

### S4820T

#### Syntax

```
ip igmp snooping fast-leave
```

To disable IGMP snooping fast leave, use the `no igmp snooping fast-leave` command.

#### Defaults

Not configured.

#### Command Modes

INTERFACE VLAN — (conf-if-vl-n)

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.0)	Introduced on the Z9500.

Version	Description
9.2(0.0)	Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
<b>E-Series legacy command.</b>	

**Usage Information**

Queriers normally send some queries when a leave message is received prior to deleting a group from the membership database. There may be situations when you require a fast deletion of a group. When you enable IGMP fast leave processing, the switch removes an interface from the multicast group as soon as it detects an IGMP version 2 leave message on the interface.

## ip igmp snooping flood

This command controls the flooding behavior of unregistered multicast data packets.

<b>Syntax</b>	<code>ip igmp snooping flood</code> To undo this configuration, use the <code>no ip igmp snooping flood</code> command.
<b>Defaults</b>	Enabled.
<b>Command Modes</b>	CONFIGURATION
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.0)	Introduced on the Z9500.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.

Version	Description
8.2.1.0	Introduced on the C-Series and S-Series.
7.7.1.0	Introduced on the E-Series.
<b>E-Series legacy command</b>	

**Usage Information**

On the C-Series and S-Series, unregistered multicast data traffic drops when you disable flooding; they do not forward the packets to multicast router ports. On the C-Series and S-Series, in order to disable Layer 2 multicast flooding, disable Layer 3 multicast (`no ip multicast-routing`).

## ip igmp snooping last-member-query-interval

The last member query interval is the maximum response time inserted into Group-Specific queries sent in response to Group-Leave messages.

### S4820T

**Syntax** `ip igmp snooping last-member-query-interval milliseconds`  
 To return to the default value, use the `no ip igmp snooping last-member-query-interval` command.

**Parameters** `milliseconds` Enter the interval in milliseconds. The range is from 100 to 65535. The default is **1000 milliseconds**.

**Defaults** **1000 milliseconds**

**Command Modes** INTERFACE VLAN

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.0)	Introduced on the Z9500.
9.2(0.0)	Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.

Version	Description
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.

**E-Series legacy command**

**Usage Information**

This last-member-query-interval is also the interval between successive Group-Specific Query messages. To change the last-member-query interval, use this command.

## ip igmp snooping mrouter

Statically configure a VLAN member port as a multicast router interface.

### S4820T

**Syntax**

`ip igmp snooping mrouter interface interface`

To delete a specific multicast router interface, use the `no igmp snooping mrouter interface interface` command.

**Parameters**

**interface  
*interface***

Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.

**Defaults**

Not configured.

**Command Modes**

INTERFACE VLAN — (conf-if-vl-n)

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.0)	Introduced on the Z9500.

Version	Description
9.2(0.0)	Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
<b>E-Series legacy command.</b>	

**Usage Information**

Dell Networking OS provides the capability of statically configuring the interface to which a multicast router is attached. To configure a static connection to the multicast router, enter the `ip igmp snooping mrouter interface` command in the VLAN context. The interface to the router must be a part of the VLAN where you are entering the command.

## ip igmp snooping querier

Enable IGMP querier processing for the VLAN interface.

### S4820T

**Syntax**

`ip igmp snooping querier`

To disable IGMP querier processing for the VLAN interface, use the `no ip igmp snooping querier` command.

**Defaults**

Not configured.

**Command Modes**

INTERFACE VLAN – (conf-if-vl-n)

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.5(0.0)	Introduced on the Z9500.
9.2(0.0)	Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.

Version	Description
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
<b>E-Series legacy command</b>	

### Usage Information

This command enables the IGMP switch to send General Queries periodically. This behavior is useful when there is no multicast router present in the VLAN because the multicast traffic is not routed. Assign an IP address to the VLAN interface for the switch to act as a querier for this VLAN.

## show ip igmp snooping groups

Display snooping related information for all the IGMP groups, interface or one group of one interface.

### S4820T

#### Syntax

```
show ip igmp snooping groups [group-address [detail] | detail |
interface [group-address [detail]]]
```

#### Parameters

<b>snooping</b>	Enter the keyword <code>snooping</code> to display snooping related information.
<b>group-address</b>	(OPTIONAL) Enter the group address in dotted decimal format to view information on that group only.
<b>interface</b>	(OPTIONAL) Enter the interface type and slot/port information: <ul style="list-style-type: none"> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li> <li>For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li> <li>For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> </ul>
<b>detail</b>	(OPTIONAL) Enter the keyword <code>detail</code> to display the IGMPv3 source information.

## Command Modes

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S4810, S4820T, S5000, S6000, Z9000, and Z9500.

## Usage Information

This command displays the IGMP database, including configured entries for either all groups on all interfaces, all groups on specific interfaces, or specific groups on specific interfaces.

The following describes the `show ip igmp groups` command shown in the following example.

Field	Description
<b>Group Address</b>	Lists the multicast address for the IGMP group.
<b>Interface</b>	Lists the interface type, slot and port number.
<b>Mode</b>	Displays the IGMP version used.
<b>Uptime</b>	Displays the amount of time the group has been operational.
<b>Expires</b>	Displays the amount of time until the entry expires.
<b>Last Reporter</b>	Displays the IP address of the last host to be a member of the IGMP group.
<b>Member Ports</b>	Indicates the port channel. If the port channel is VLT, an asterisk (*) after the port channel number indicates the port channel is locally down and that a remote VLT port is up.

## Example

```
Dell#show ip igmp snooping groups
Total Number of Groups: 1
IGMP Connected Group Membership
Group Address      Interface      Mode          Uptime
Expires  Last Reporter
225.1.1.1          Vlan 10      IGMPv2-Compat 00:00:07
00:02:09  1.1.1.2
  Member Ports: Te 1/17
Dell#
```

## show ip igmp snooping mrouter

Display multicast router interfaces.

### S4820T

<b>Syntax</b>	<code>show ip igmp snooping mrouter [vlan number]</code>																		
<b>Parameters</b>	<table><tr><td><b>vlan number</b></td><td>Enter the keyword <code>vlan</code> then the vlan number. The range is from 1 to 4094.</td></tr></table>	<b>vlan number</b>	Enter the keyword <code>vlan</code> then the vlan number. The range is from 1 to 4094.																
<b>vlan number</b>	Enter the keyword <code>vlan</code> then the vlan number. The range is from 1 to 4094.																		
<b>Command Modes</b>	<ul style="list-style-type: none"><li>EXEC</li><li>EXEC Privilege</li></ul>

# Interfaces

The commands in this chapter are supported by Dell Networking operating software on the S8420T platform.

This chapter contains the following sections:

- Basic Interface Commands
- Port Channel Commands
- Time Domain Reflectometer (TDR)
- UDP Broadcast

## Basic Interface Commands

The following commands are for Physical, Loopback, and Null interfaces.

### clear counters

Clear the counters used in the show interfaces commands for all virtual router redundancy protocol (VRRP) groups, virtual local area networks (VLANs), and physical interfaces, or selected ones.

#### S4820T

**Syntax** `clear counters [interface] [vrrp [ipv6 {vrid}] | learning-limit | vlan vlan-id]`

**Parameters**

***interface*** (OPTIONAL) Enter any of the following keywords and slot/port or number to clear counters from a specified interface:

- For IPv4 access-group counters, enter the keyword `ip`.
- For IPv6 access-group counters, enter the keyword `ipv6`.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For MAC access-group counters, enter the keyword `mac`.
- For a Port Channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For the management interface, enter the keyword `ManagementEthernet` then slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.

- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a tunnel interface, enter the keyword `tunnel`. The range is from 1 to 16383.

<b>vrrp</b> <b>[[ipv6] vrid]</b>	(OPTIONAL) Enter the keyword <code>vrrp</code> to clear the counters of all VRRP groups. To clear the counters of VRRP groups on all IPv6 interfaces, enter <code>ipv6</code> . To clear the counters of a specified group, enter a VRID number from 1 to 255.
<b>learning-limit</b>	(OPTIONAL) Enter the keywords <code>learning-limit</code> to clear unknown source address (SA) drop counters when MAC learning limit is configured on the interface.
<b>vlan</b> <b>vlan-id</b>	Enter the keyword <code>vlan</code> followed by the interface VLAN number. The range is from 1 to 4094.

**Defaults**

Without an interface specified, the command clears all interface counters.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.7(0.0)	Added the <code>vlan</code> parameter.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.5.1.0	Added support for 4-port 40G line cards on ExaScale.
8.4.1.0	Added support (E-Series only) for VRRP groups in a VRF instance.
8.3.7.0	Introduced on the S4810.
8.2.1.0	Added support for 4093 VLANs on the E-Series ExaScale. Prior to the release, 2094 was supported.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.5.1.0	Updated the definition of the <code>learning-limit</code> option for clarity.

**Example** Dell#clear counters  
Clear counters on all interfaces [confirm]

**Related Commands** [mac learning-limit](#) — allows aging of MACs even though a learning-limit is configured or disallow station move on learned MACs.

[show interfaces](#) — displays information on the interfaces.

## clear dampening

Clear the dampening counters on all the interfaces or just the specified interface.

### S4820T

**Syntax** clear dampening [*interface*]

**Parameters**

***interface*** (OPTIONAL) Enter any of the following keywords and slot/port or number to clear counters from a specified interface:

- For a Port Channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**Defaults** Without an interface specified, the command clears all interface dampening counters.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.5.1.0	Added support for 4-port 40G line cards on ExaScale.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.

Version	Description
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Introduced on the E-Series.

**Usage Information** After you enter the `clear counters` command and verify the results with the `show interfaces` command, the line rate is not reset to 0.00%.

**Example**

```
Dell#clear dampening tegigabitethernet 1/10
Clear dampening counters on TeGi 1/10 [confirm] y
Dell#
```

**Related Commands**

[show interfaces dampening](#) — displays interface dampening information.

[dampening](#) — configures dampening on an interface.

## dampening

Configure dampening on an interface.

### S4820T

**Syntax** `dampening [[half-life] [reuse-threshold]] [suppress-threshold] [max-suppress-time]`

**Parameters**

<i>half-life</i>	Enter the number of seconds after which the penalty is decreased. The penalty decreases half after the half-life period expires. The range is from 1 to 30 seconds. The default is <b>5 seconds</b> .
<i>reuse-threshold</i>	Enter a number as the reuse threshold, the penalty value below which the interface state is changed to "up". The range is from 1 to 20000. The default is <b>750</b> .
<i>suppress-threshold</i>	Enter a number as the suppress threshold, the penalty value above which the interface state is changed to "error disabled". The range is from 1 to 20000. The default is <b>2500</b> .
<i>max-suppress-time</i>	Enter the maximum number for which a route can be suppressed. The default is four times the half-life value. The range is from 1 to 86400. The default is <b>20 seconds</b> .

**Defaults** Disabled.

**Command Modes** INTERFACE (conf-if-)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.12.0	Introduced on the S4810.
8.3.11.1	Introduced on the Z9000.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Introduced on the E-Series.

#### Usage Information

With each flap, Dell Networking OS penalizes the interface by assigning a penalty (1024) that decays exponentially depending on the configured half-life. After the accumulated penalty exceeds the suppress threshold value, the interface moves to the Error-Disabled state. This interface state is deemed as "down" by all static/dynamic Layer 2 and Layer 3 protocols. The penalty is exponentially decayed based on the half-life timer. After the penalty decays below the reuse threshold, the interface enables. The configured parameters are as follows:

- `suppress-threshold` should be greater than `reuse-threshold`
- `max-suppress-time` should be at least 4 times `half-life`

**NOTE:** You cannot apply dampening on an interface that is monitoring traffic for other interfaces.

#### Example

```
Dell(conf-if-te-1/10)#dampening 20 800 4500 120
Dell(conf-if-te-1/10)#
```

#### Related Commands

[clear dampening](#) — clears the dampening counters on all the interfaces or just the specified interface.

[show interfaces dampening](#) — displays interface dampening information.

## description

Assign a descriptive text string to the interface.

### S4820T

#### Syntax

```
description desc_text
```

To delete a description, use the `no description` command.

<b>Parameters</b>	<code>desc_text</code>	Enter a text string up to 240 characters long.
<b>Defaults</b>	none	
<b>Command Modes</b>	INTERFACE	
<b>Command History</b>	This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .	

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
7.4.1.0	Modified for E-Series: Revised from 78 to 240 characters.

**Usage Information**

**Important Points to Remember:**

- To use special characters as a part of the description string, you must enclose the whole string in double quotes.
- Spaces between characters are not preserved after entering this command unless you enclose the entire description in quotation marks ("`desc_text`").
- Entering a text string after the `description` command overwrites any previous text string that you previously configured as the description.
- The `shutdown` and `description` commands are the only commands that you can configure on an interface that is a member of a port-channel.
- Use the `show interfaces description` command to display descriptions configured for each interface.

## duplex (10/100 Interfaces)

Configure duplex mode on any physical interfaces where the speed is set to 10/100.

**Syntax**

```
duplex {half | full}
```

To return to the default setting, use the `no duplex` command.

<b>Parameters</b>	<b>half</b>	Enter the keyword <code>half</code> to set the physical interface to transmit only in one direction.
	<b>full</b>	Enter the keyword <code>full</code> to set the physical interface to transmit in both directions.

**Defaults** Not configured.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
9.7(0.0)	Introduced on the S6000-ON.
9.0.2.0	Introduced on the S6000.
8.3.19.0	Introduced on the S4820T.
8.3.11.1	Introduced on the Z9000.
8.3.7.0	Introduced on the S4810.
8.1.1.0	Introduced on the E-Series ExaScale.
7.6.1.0	Introduced on the S-Series.
7.5.1.0	Introduced on the C-Series.
6.4.1.0	Introduced

**Usage Information** This command applies to any physical interface with speed set to 10/100.

**NOTE:** Starting with Dell Networking OS version 7.8.1.0, when you use a copper SFP2 module with catalog number GP-SFP2-1T in the S25P model of the S-Series, you can manually set its speed with the `speed` command. When you set the speed to 10 Mbps or 100 Mbps, you can also execute the `duplex` command.

**Related Commands** [negotiation auto](#) — enables or disables auto-negotiation on an interface.

## flowcontrol

Control how the system responds to and generates 802.3x pause frames on 10 Gig ports.

**Syntax** `flowcontrol rx {off | on} tx {off | on} [negotiate]`

## Parameters

<b>rx on</b>	Enter the keywords <code>rx on</code> to process the received flow control frames on this port. This is the default value for the receive side.
<b>rx off</b>	Enter the keywords <code>rx off</code> to ignore the received flow control frames on this port.
<b>tx on</b>	Enter the keywords <code>tx on</code> to send control frames from this port to the connected device when a higher rate of traffic is received.
<b>tx off</b>	Enter the keywords <code>tx off</code> so that flow control frames are not sent from this port to the connected device when a higher rate of traffic is received.
<b>negotiate</b>	(Optional) Enter the keyword <code>negotiate</code> to enable the pause-negotiation with the egress port of the peer device. If the <code>negotiate</code> command is not used, pause-negotiation is disabled. 40 gigabit Ethernet interfaces do not support pause-negotiation

## Defaults

**rx on tx off**

## Command Modes

INTERFACE

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

Version	Description
<b>9.7(0.0)</b>	Introduced on the S6000-ON.
<b>9.6.0.0</b>	Added support for the negotiate feature on the S4810 and S4820T.
<b>9.0.2.0</b>	Introduced on the S6000.
<b>8.3.19.0</b>	Introduced on the S4820T.
<b>8.3.11.1</b>	Introduced on the Z9000.
<b>8.3.7.0</b>	Introduced on the S4810.
<b>8.1.1.0</b>	Introduced on the E-Series ExaScale.
<b>6.5.1.9 and 7.4.1.0</b>	Introduced on the E-Series.
<b>7.8.1.0</b>	Introduced on the C-Series and S-Series with the <code>thresholds</code> option.

## Usage Information

The globally assigned 48-bit Multicast address 01-80-C2-00-00-01 is used to send and receive pause frames. To allow full-duplex flow control, stations implementing

the pause operation instruct the MAC to enable the reception of frames with a destination address equal to this multicast address.

When a port receives traffic at a higher rate than it can process, the frames are stored in the port buffer. As a result, buffer usage increases. When the buffer usage reaches the value specified in the "pause-threshold" argument, the port sends PAUSE frame to the connected link partner to stop sending the traffic. Eventually this reduces the buffer usage. When the buffer usage drops by the value specified in the "resume-threshold", the port again sends a PAUSE frame with 0 as wait-time. This results in resume of the paused traffic flow.

### Important Points to Remember

- Do not enable `tx pause` when buffer carving is enabled. For information and assistance, consult Dell Networking TAC.
- The only configuration applicable to half duplex ports is `rx off tx off`. The following error is returned:

```
Can't configure flowcontrol when half duplex is configure,
config ignored
```

- Half duplex cannot be configured when the flow control configuration is on (default is `rx on tx on`). The following error is returned:
- ```
Can't configure half duplex when flowcontrol is on, config
ignored
```

**NOTE:** The flow control must be off (`rx off tx off`) before configuring the half duplex.

- Speeds less than 1 Gig cannot be configured when the asymmetric flow control configuration is on. The following error is returned:

```
Can't configure speed <1G when Asymmetric flowcontrol is on,
config ignored
```

- Dell Networking OS only supports `rx on tx on` and `rx off tx off` for speeds less than 1 Gig (Symmetric).

**NOTE:** If you use the `disable rx flow control` command, Dell Networking recommends rebooting the system.

### Example

```
Dell(conf-if-Te-1/1)#show config
!
interface TenGigabitEthernet 1/1
no ip address
switchport
no negotiation auto
flowcontrol rx off tx on
no shutdown
...
```

### Example (Values)

This Example shows how Dell Networking OS negotiates the flow control values between two Dell Networking chassis connected back-to-back using 1G copper ports.

Configured

```
LocRxConf LocTxConf RemoteRxConf RemoteTxConf
```

|     |     |                        |                        |

**Related  
Commands**

[show running-config](#) — displays the flow configuration parameters (non-default values only).

[show interfaces](#) — displays the negotiated flow control parameters.

## interface

Configure a physical interface on the switch.

### S4820T

**Syntax**

`interface interface range`

**Parameters**

***interface***

Enter one of the following keywords and slot/port or number information:

- For a null interface, enter the keyword `null` then the slot/port information. The Null interface number is 0.
- For the Management interface on the stack-unit, enter the keyword `ManagementEthernet` then the slot/port information. The slot range is from 0 to 1. The port range is 0.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Tunnel interface, enter the keyword `tunnel` then the tunnel ID. The range is from 1 to 16383.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**range** (Optional) Enter the keyword `range` to configure an interface range.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                          |
|----------|------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                          |
| 9.4(0.0) | Added the support for interfaces.                    |
| 9.0.2.0  | Introduced on the S6000.                             |
| 8.3.19.0 | Introduced on the S4820T.                            |
| 8.3.11.1 | Introduced on the Z9000.                             |
| 8.3.7.0  | Introduced on the S4810.                             |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale. |
| 8.1.1.0  | Introduced on the E-Series ExaScale.                 |
| 7.6.1.0  | Introduced on the S-Series.                          |
| 7.5.1.0  | Introduced on the C-Series.                          |
| 6.4.1.0  | Introduced                                           |

**Usage Information** You cannot delete a physical interface.

By default, physical interfaces are disabled (`shutdown`) and are not assigned to an IP address or switchport. To place an interface in Layer 2 mode, ensure that the

interface's configuration does not contain an IP address and enter the `switchport` command.

You can create up to 64 tunnel interfaces. The tunnel is added as a logical interface with no default configuration. To delete a tunnel interface, use the `no interface tunnel tunnel-id` command.

The tunnel interface operates as an ECMP (equal cost multi path) only when the next hop to the tunnel destination is over a physical interface. If you select any other interface as the next hop to the tunnel destination, the tunnel interface does not operate as an ECMP.

#### Example

```
Dell(conf)#int tengigabitethernet 1/10
Dell(conf-if-te-1/10)#exit
Dell(conf)#
```

#### Related Commands

[interface loopback](#) — configures a Loopback interface.

[interface null](#) — configures a Null interface.

[interface port-channel](#) — configures a port channel.

[interface vlan](#) — configures a VLAN.

[show interfaces](#) — displays the interface configuration.

## interface group

Create or delete group of VLANs with a single command. You can also use this command to apply a set of configurations on a group of interfaces.

### S4820T

#### Syntax

```
interface group [fortyGigE slot/port { - port } |
tengigabitethernet slot/port { - port } | vlan vlanid { -
vlanid } ]
```

To delete a range of VLANs, use the following command: `no interface group vlan vlanid{- vlanid}`

#### Parameters

***interface,***  
***interface,...***

Enter the keywords `interface group` and one of the interfaces — `slot/port` or VLAN number. Select the range of interfaces for bulk configuration. Spaces are not required between the commas. Comma-separated ranges can include VLANs and physical interfaces.

Enter the member VLANs using VLAN IDs (separated by commas), a range of VLAN IDs (separated by a hyphen), a single VLAN ID, or a combination. For example: VLAN IDs

(comma-separated): 3, 4, 6. Range (hyphen-separated): 5-10.

Slot/Port information need not contain a space before and after the dash. For example, both of the following commands are valid: `interface group tengigabitethernet 1/1 - 5 ;` `interface group tengigabitethernet 1/1-5;;`.

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

#### Command Modes

CONFIGURATION

#### Command History

##### Version

##### Description

9.7(0.0)

Introduced on the S6000-ON.

9.4(0.0)

Introduced on the S4810, S4820T, S6000, Z9000, and MXL Switch.

#### Usage Information

The `interface group` command will create all the non-existent VLANs specified in the range. On successful command execution, the CLI switches to the interface group context.

The configuration commands inside the group context will be the similar to that of the existing range command.

Note: For release 9.4(0.0), the group command is supported only for VLANs and physical interfaces.

#### Example

```
Dell(conf)#interface group ?
fortyGigE          FortyGigabit Ethernet interface
gigabitethernet   GigabitEthernet interface IEEE 802.3z
tengigabitethernet TenGigabit Ethernet interface
vlan               VLAN keyword
```

```
Dell(conf)# interface group vlan 1 - 2 , tengigabitethernet
1/10
Dell(conf-if-group-vl-1-2,te-1/10)# no shutdown
Dell(conf-if-group-vl-1-2,te-1/10)# end
```

#### Related Commands

[interface range](#) — Configures a range of interfaces.

[interface vlan](#) — Configures a VLAN.

## interface loopback

Configure a Loopback interface.

|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## interface ManagementEthernet

Configure the Management port on the system (either the Primary or Standby RPM).

### S4820T

**Syntax** `interface ManagementEthernet slot/port`

**Parameters**

|                  |                                                                                                             |
|------------------|-------------------------------------------------------------------------------------------------------------|
| <b>slot/port</b> | Enter the keyword <code>ManagementEthernet</code> , then the slot number (0 or 1) and port number zero (0). |
|------------------|-------------------------------------------------------------------------------------------------------------|

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                            |
|----------|----------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.            |
| 9.0.2.0  | Introduced on the S6000.               |
| 8.3.19.0 | Introduced on the S4820T.              |
| 8.3.11.1 | Introduced on the Z9000.               |
| 8.3.11.1 | Introduced on the S55, S60, and S4810. |
| 8.1.1.0  | Introduced on the E-Series ExaScale.   |
| 7.5.1.0  | Introduced on the C-Series.            |
| 6.4.1.0  | Introduced                             |

**Usage Information** You cannot delete a Management port.

The Management port is enabled by default (`no shutdown`). To assign an IP address to the Management port, use the `ip address` command.

If your system has two RPMs installed, use the `show redundancy` command to display which RPM is the Primary RPM.

**Example**

```
Dell(conf)#interface managementethernet 0/0
Dell(conf-if-ma-0/0)#
```

**Related Commands** [management route](#) — configures a static route that points to the Management interface or a forwarding router.

[speed \(Management interface\)](#) — clears the FIB entries on a specified line card.

## interface null

Configure a Null interface on the switch.

### S4820T

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>interface null <i>number</i></code>                                                                                                                      |
| <b>Parameters</b>      | <b><i>number</i></b> Enter zero (0) as the Null interface number.                                                                                              |
| <b>Defaults</b>        | Not configured; number = <b>0</b>                                                                                                                              |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                  |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                          |
|----------|--------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.          |
| 9.0.2.0  | Introduced on the S6000.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.3.7.0  | Introduced on the S4810.             |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 7.6.1.0  | Introduced on the S-Series.          |
| 7.5.1.0  | Introduced on the C-Series.          |
| 6.4.1.0  | Introduced                           |

**Usage Information** You cannot delete the Null interface. The only configuration command possible in a Null interface is `ip unreachable`.

**Example**  
Dell(conf)#interface null 0  
Dell(conf-if-nu-0)#

**Related Commands**

- [interface](#) — configures a physical interface.
- [interface loopback](#) — configures a Loopback interface.
- [interface port-channel](#) — configures a port channel.
- [interface vlan](#) — configures a VLAN.

[ip unreachable](#) — enables generation of internet control message protocol (ICMP) unreachable messages.

## interface range

This command permits configuration of a range of interfaces to which subsequent commands are applied (bulk configuration). Using the `interface range` command, you can enter identical commands for a range of interface.

### S4820T

**Syntax** `interface range interface {slot/port | port} - port}, interface {slot/port | port} - port},...`

**Parameters** `interface {slot/port | port} - port}, interface {slot/port | port} - port},...`

Enter `interface range` and one of the interfaces and then slot/port, port-channel, or VLAN number information. Select the range of interfaces for bulk configuration. You can enter up to six comma-separated ranges. Spaces are not required between the commas. The ranges can include VLANs, port-channels, and physical interfaces.

- For a port channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- For a Tunnel interface, enter the keyword `Tunnel` then a number from 1 to 16383.

**Defaults** None

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |

| Version | Description                                                                       |
|---------|-----------------------------------------------------------------------------------|
| 8.3.7.0 | Introduced on the S4810.                                                          |
| 8.5.1.0 | Added support for 4-port 40G line cards on ExaScale.                              |
| 8.2.1.0 | Added support for 4093 VLANs on E-Series ExaScale. Prior releases supported 2094. |
| 8.1.1.0 | Introduced on the E-Series ExaScale.                                              |
| 7.6.1.0 | Introduced on the S-Series.                                                       |
| 7.5.1.0 | Introduced on the C-Series.                                                       |
| 6.1.1.0 | Introduced on the E-Series.                                                       |

### Usage Information

When creating an interface range, interfaces appear in the order they are entered; they are not sorted. The command verifies that interfaces are present (physical) or configured (logical).

#### Important Points to Remember:

- Bulk configuration is created if at least one interface is valid.
- Non-existing interfaces are excluded from the bulk configuration with a warning message.
- The `interface range` prompt includes interface types with slot/port information for valid interfaces. The prompt allows for a maximum of 32 characters. If the bulk configuration exceeds 32 characters, it is represented by an ellipsis (...).
- When the `interface range` prompt has multiple port ranges, the smaller port range is excluded from the prompt.
- If overlapping port ranges are specified, the port range is extended to the smallest start port and the biggest end port.

### Example (Bulk)

```
Dell(conf)#interface range tengigbitethernet 2/1 - 11,
fortyGigbE 3/3, tengigbitethernet 3/10
% Warning: Non-existing ports (not configured) are ignored by
interface-range
```

### Example (Multiple Ports)

```
Dell(conf)#interface range tengigabitethernet 2/10 - 23,
tengigabitethernet 2/12 - 17
Dell(conf-if-range-te-2/10-23)#
```

### Example (Overlapping Ports)

```
Dell(conf)#interface range tengigabitethernet 2/3 - 11,
tengigabitethernet 2/3 - 23
Dell(conf-if-range-te-2/3-23)#
```

### Usage Information

Only VLAN and port-channel interfaces created using the `interface vlan` and `interface port-channel` commands can be used in the `interface range` command.

Use the `show running-config` command to display the VLAN and port-channel interfaces. VLAN or port-channel interfaces that are not displayed in the `show running-config` command cannot be used with the bulk configuration feature of

the `interface range` command. You cannot create virtual interfaces (VLAN, Port-channel) using the `interface range` command.

**NOTE:** If a range has VLAN, physical and port-channel interfaces, only commands related to physical interfaces can be bulk configured. To configure commands specific to VLAN and port-channel only those respective interfaces should be configured in a particular range.

#### Example (Single Range)

This example shows a single range bulk configuration.

```
Dell(config)# interface range tengigabitethernet 5/3 - 23
Dell(config-if-range-te-5/3-23)# no shutdown
Dell(config-if-range-te-5/3-23#
```

#### Example (Multiple Range)

This example shows how to use commas to add different interface types to the range enabling all Tenggigabit Ethernet interfaces in the range 5/1 to 5/23 and both Tenggigabit Ethernet interfaces 1/1 and 1/2.

```
Dell(config-if)# interface range tengigabitethernet 5/1 -
5/23, tengigabitethernet 1/1 - 1/2
Dell(config-if-range-te-1/1-2,te-5/1-23)# no shutdown
Dell(config-if-range-te-1/1-2,te-5/1-23)#
```

#### Example (Multiple Range)

This example shows how to use commas to add VLAN and port-channel interfaces to the range.

```
Dell(config-if)# interface range tengigabitethernet 5/1 - 23,
tengigabitethernet 1/1 - 2,
Vlan 2-100, Port 1-25
Dell(config-if-range-te-1/1-2,te-5/1-23,vl-2-100,po-1-25) #
no shutdown
Dell(config-if-range-te-5/1-24,te-1/1-2,vl-2-100,po-1-25) #
```

#### Related Commands

[interface port-channel](#) — configures a port channel group.

[interface vlan](#) — configures a VLAN interface.

[show config \(from INTERFACE RANGE mode\)](#) — shows the bulk configuration interfaces.

[show range](#) — shows the bulk configuration ranges.

[interface range macro \(define\)](#) — defines a macro for an interface-range.

## interface range macro (define)

Defines a macro for an interface range and then saves the macro in the running configuration.

### S4820T

#### Syntax

```
define interface range macro name interface , interface , ...
```

## Parameters

|                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>name</i></b>                                | Enter up to 16 characters for the macro name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>interface,</i><br/><i>interface,...</i></b> | <p>Enter the keywords <code>interface range</code> and one of the interfaces — slot/port, port-channel, or VLAN number. Select the range of interfaces for bulk configuration. You can enter up to six comma-separated ranges. Spaces are not required between the commas. Comma-separated ranges can include VLANs, port-channels, and physical interfaces.</p> <ul style="list-style-type: none"><li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number. ## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version                | Description                                                                       |
|------------------------|-----------------------------------------------------------------------------------|
| 9.7(0.0)               | Introduced on the S6000-ON.                                                       |
| 9.0.2.0                | Introduced on the S6000.                                                          |
| 8.3.19.0               | Introduced on the S4820T.                                                         |
| 8.3.11.1               | Introduced on the Z9000.                                                          |
| 8.3.7.0                | Introduced on the S4810.                                                          |
| 8.5.1.0                | Added support for 4-port 40G line cards on ExaScale.                              |
| 8.2.1.0                | Added support for 4093 VLANs on E-Series ExaScale. Prior releases supported 2094. |
| 8.1.1.0                | Introduced on the E-Series ExaScale.                                              |
| 7.6.1.0                | Introduced on the S-Series.                                                       |
| 7.5.1.0                | Introduced on the C-Series.                                                       |
| pre-Version<br>6.1.1.0 | Introduced on the E-Series.                                                       |

### Example (Single Range)

This example shows how to define an interface range macro named test. Execute the `show running-config` command to display the macro definition.

```
Dell(config)# define interface-range test tengigabitethernet
1/1 -3,
tengigabitethernet 5/1 -47, tengigabitethernet 13/1 -89
```

```
Dell# show running-config | grep define
define interface-range test tengigabitethernet 1/1 -3,
tengigabitethernet 5/1 -47,
tengigabitethernet 13/1 - 89
Dell(config)#interface range macro test
Dell(config-if-range-te-1/1-3,te-5/1-47,te-13/1-89)#
```

### Related Commands

[interface range](#) – configures a range of command (bulk configuration)

[interface range macro name](#) – runs an interface range macro.

## interface range macro name

Run the interface-range macro to automatically configure the pre-defined range of interfaces.

### S4820T

#### Syntax

```
interface range macro name
```

#### Parameters

***name*** Enter the name of an existing macro.

#### Defaults

none

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                          |
|----------|--------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.          |
| 9.0.2.0  | Introduced on the S6000.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.3.7.0  | Introduced on the S4810.             |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 7.6.1.0  | Introduced on the S-Series.          |
| 7.5.1.0  | Introduced on the C-Series.          |

| Version | Description |
|---------|-------------|
| 6.2.1.0 | Introduced  |

### Example (Single Range)

This example shows the macro named *test* that was defined earlier.

```
Dell(config)#interface range macro test
Dell(config-if-range-te-1/1-3,te-5/1-47,te-13/1-89)#
Dell
```

### Related Commands

[interface range](#) — configures a range of command (bulk configuration).

[interface range macro \(define\)](#) — defines a macro for an interface range (bulk configuration).

## interface vlan

Configure a VLAN. You can configure up to 4094 VLANs.

### S4820T

#### Syntax

```
interface vlan vlan-id [of-instance{of-id}]
```

#### Parameters

***of-instance*{*of-id*}**

Enter the keyword **of-instance** then the OpenFlow instance ID to add the VLAN to the specified OpenFlow instance. The range is from 1 to 8.

**NOTE:** Associate the OpenFlow instance with the VLAN when the VLAN is created. An existing VLAN cannot be associated with an OpenFlow instance.

#### Defaults

Not configured, except for the Default VLAN, which is configured as VLAN 1.

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                                          |
|-----------|------------------------------------------------------|
| 9.0.2.0   | Introduced on the S6000.                             |
| 9.1.(0.0) | Introduced on the S4810; added support for OpenFlow. |
| 8.3.19.0  | Introduced on the S4820T.                            |
| 8.3.11.1  | Introduced on the Z9000.                             |

## Usage Information

For more information about VLANs and the commands to configure them, refer to the [Virtual LAN \(VLAN\) Commands](#) section of the [Layer 2](#) chapter.

FTP, TFTP, and SNMP operations are not supported on a VLAN. MAC ACLs are not supported in VLANs. IP ACLs are supported. For more information, refer to the [Access Control Lists \(ACL\)](#) chapter.

The following features are not supported on VLANs associated with an OpenFlow instance:

- IPv4
- IPv6
- MTU

If OpenFlow VLANs are configured on the switch, spanning-tree protocols cannot be enabled simultaneously.

## Example (Single Range)

```
Dell(conf)#int vlan 3
Dell(conf-if-vl-3)#
```

## Related Commands

[interface](#) — configures a physical interface.

[interface loopback](#) — configures a loopback interface.

[interface null](#) — configures a null interface.

[interface port-channel](#) — configures a port channel group.

[show vlan](#) — displays the current VLAN configuration on the switch.

[shutdown](#) — disables/enables the VLAN.

[tagged](#) — adds a Layer 2 interface to a VLAN as a tagged interface.

[untagged](#) — adds a Layer 2 interface to a VLAN as an untagged interface.

## intf-type cr4 autoneg

Set the interface type as CR4 with auto-negotiation enabled.

### S4820T

#### Syntax

```
intf-type cr4 autoneg
```

If you configure `intf-type cr4 autoneg`, use the `no intf-type cr4 autoneg` command to set the interface type as CR4 with autonegotiation disabled.

#### Defaults

Not configured

**Command Modes** INTERFACE

| <b>Command History</b> | <b>Version</b> | <b>Description</b>                               |
|------------------------|----------------|--------------------------------------------------|
|                        | 9.7(0.0)       | Introduced on the S6000-ON.                      |
|                        | 9.0.2.0        | Introduced on the S6000.                         |
|                        | 8.3.19.0       | Introduced on the S4820T.                        |
|                        | 8.3.11.1       | Introduced on the Z9000.                         |
|                        | 8.3.7.0        | Introduced on the S4810.                         |
|                        | 8.3.16.1       | Introduced on the MXL 10/40GbE Switch IO Module. |

**Usage Information** If you configure the interface type as CR4 with auto-negotiation enabled, also configure CR4 with auto-negotiation. Many DAC cable link issues are resolved by setting the interface type as CR4.

If the CR4 optic fails to come up, use the `autoneg` option.

- Related Commands**
- [Interfaces](#) — configures a physical interface.
  - [interface loopback](#) — configures a loopback interface.
  - [interface null](#) — configures a null interface.
  - [interface port-channel](#) — configures a port channel group.

## negotiation auto

Enable auto-negotiation on an interface.

### S4820T

**Syntax** `negotiation auto`  
To disable auto-negotiation, use the `no negotiation auto` command.

**Defaults** Enabled.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| <b>Version</b> | <b>Description</b>          |
|----------------|-----------------------------|
| 9.7(0.0)       | Introduced on the S6000-ON. |

| Version     | Description                          |
|-------------|--------------------------------------|
| 9.0.2.0     | Introduced on the S6000.             |
| 8.3.19.0    | Introduced on the S4820T.            |
| 8.3.11.0    | Introduced on the Z9000.             |
| 8.3.7.0     | Introduced on the S4810.             |
| 8.1.1.0     | Introduced on the E-Series ExaScale. |
| 7.6.1.0     | Introduced on the S-Series.          |
| 7.5.1.0     | Introduced on the C-Series.          |
| pre-6.2.1.0 | Introduced on the E-Series.          |

### Usage Information

This command is supported on C-Series, S-Series, and E-Series (TeraScale and ExaScale) 10/100/1000 Base-T Ethernet interfaces.

The `no negotiation auto` command is only available if you first manually set the speed of a port to **10Mbits** or **100Mbits**.

The `negotiation auto` command provides a `mode` option for configuring an individual port to forced-master/forced slave after you enable auto-negotiation.

**NOTE:** The `mode` option is not available on non-10/100/1000 Base-T Ethernet line cards.

If you do not use the `mode` option, the default setting is **slave**. If you do not configure forced-master or forced-slave on a port, the port negotiates to either a master or a slave state. Port status is one of the following:

- Forced-master
- Force-slave
- Master
- Slave
- Auto-neg Error — typically indicates that both ends of the node are configured with forced-master or forced-slave.

**CAUTION:** Ensure that one end of your node is configured as forced-master and one is configured as forced-slave. If both are configured the same (that is, forced-master or forced-slave), the `show interfaces` command flaps between an auto-neg-error and forced-master/slave states.

You can display master/slave settings with the `show interfaces` command.

### Example (Master/Slave)

```
Dell(conf)# interface tengigabitethernet 1/1
Dell(conf-if)#neg auto
Dell(conf-if-autoneg)# ?

end          Exit from configuration mode
exit        Exit from autoneg configuration mode
mode        Specify autoneg mode
no          Negate a command or set its defaults
show        Show autoneg configuration information
```

```
Dell(conf-if-autoneg)#mode ?
forced-master Force port to master mode
forced-slave Force port to slave mode
Dell(conf-if-autoneg)#
```

**Example  
(Configured)**

```
Dell#show interfaces configured
TenGigabitEthernet 13/18 is up, line protocol is up
Hardware is Force10Eth, address is 00:01:e8:05:f7:fc
  Current address is 00:01:e8:05:f7:fc
Interface index is 474791997
Internet address is 1.1.1.1/24
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed 1000 Mbit, Mode full duplex, Master
ARP type: ARPA, ARP Timeout 04:00:00
Last clearing of "show interfaces" counters 00:12:42
Queueing strategy: fifo
Input Statistics:
...
```

**User  
Information**

Both sides of the link must have auto-negotiation enabled or disabled for the link to come up.

The following details the possible speed and auto-negotiation combinations for a line between two 10/100/1000 Base-T Ethernet interfaces.

**Port 0**

- auto-negotiation enabled\* speed 1000 or auto
- auto-negotiation enabled speed 100
- auto-negotiation disabled speed 100
- auto-negotiation disabled speed 100
- auto-negotiation enabled\* speed 1000 or auto

**Port 1**

- auto-negotiation enabled\* speed 1000 or auto
- auto-negotiation enabled speed 100
- auto-negotiation disabled speed 100
- auto-negotiation enabled speed 100
- auto-negotiation disabled speed 100

**Link Status Between Port 1 and Port 2**

- Up at 1000 Mb/s
- Up at 100 Mb/s
- Up at 100 Mb/s
- Down
- Down

\* You cannot disable auto-negotiation when the speed is set to 1000 or auto.

## keepalive

Send keepalive packets periodically to keep an interface alive when it is not transmitting data.

### S4820T

|                        |                                                                                                                                                                |

| <b>Syntax</b>          | <code>keepalive</code><br>To stop sending keepalive packets, use the <code>no keepalive</code> command.                                                        |
| <b>Defaults</b>        | Enabled.                                                                                                                                                       |
| <b>Command Modes</b>   | INTERFACE                                                                                                                                                      |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version                | Description                          |
|------------------------|--------------------------------------|
| 9.0.2.0                | Introduced on the S6000.             |
| 8.3.19.0               | Introduced on the S4820T.            |
| 8.3.11.1               | Introduced on the Z9000.             |
| 8.3.7.0                | Introduced on the S4810.             |
| 8.1.1.2                | Introduced on the E-Series ExaScale. |
| 7.6.1.0                | Introduced on the S-Series.          |
| 7.5.1.0                | Introduced on the C-Series.          |
| pre-Version<br>6.1.1.0 | Introduced on the E-Series.          |

|                          |                                                                                                                                                                                                                                                                                                                                              |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | When you configure <code>keepalive</code> , the system sends a self-addressed packet out of the configured interface to verify that the far end of a WAN link is up. When you configure <code>no keepalive</code> , the system does not send keepalive packets and so the local end of a WAN link remains up even if the remote end is down. |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## monitor interface

Monitor counters on a single interface or all interfaces on a line card. The screen is refreshed every five seconds and the CLI prompt disappears.

|               |                                                                                                                                 |
|---------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <code>monitor interface [interface]</code><br>To disable monitoring and return to the CLI prompt, press the <code>q</code> key. |
|---------------|---------------------------------------------------------------------------------------------------------------------------------|

## Parameters

### *interface*

(OPTIONAL) Enter the following keywords and slot/port or number information:

- For the Management interface on the stack-unit, enter the keyword `ManagementEthernet` then the slot/port information. The slot range is from 0 to 1. The port range is 0.
- For a Tunnel interface, enter the keyword `tunnel` then the slot/port. The range is from 1 to 16383.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

## Command Modes

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version                | Description                                          |
|------------------------|------------------------------------------------------|
| 9.0.2.0                | Introduced on the S6000.                             |
| 8.3.19.0               | Introduced on the S4820T.                            |
| 8.3.11.1               | Introduced on the Z9000.                             |
| 8.5.1.0                | Added support for 4-port 40G line cards on ExaScale. |
| 8.3.7.0                | Introduced on the S4810.                             |
| 8.1.1.0                | Introduced on the E-Series ExaScale.                 |
| 7.6.1.0                | Introduced on the S-Series.                          |
| 7.5.1.0                | Introduced on the C-Series.                          |
| pre-Version<br>6.2.1.0 | Introduced on the E-Series.                          |

## Usage Information

In the Example, the delta column displays changes since the last screen refresh. The following are the `monitor` command menu options.

| Key                     | Description                                    |
|-------------------------|------------------------------------------------|
| <code>systemst-3</code> | Displays the host name assigned to the system. |

| Key                 | Description                                                                                                                 |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <b>monitor time</b> | Displays the amount of time since the <code>monitor interface</code> command was entered.                                   |
| <b>time</b>         | Displays the amount of time the chassis is up (since last reboot).                                                          |
| <b>m</b>            | Change the view from a single interface to all interfaces on the line card or visa-versa.                                   |
| <b>c</b>            | Refresh the view.                                                                                                           |
| <b>b</b>            | Change the counters displayed from Packets on the interface to Bytes.                                                       |
| <b>r</b>            | Change the [delta] column from change in the number of packets/bytes in the last interval to rate per second.               |
| <b>l</b>            | Change the view to the next interface on the line card, or if in line card mode, the next line card in the chassis.         |
| <b>a</b>            | Change the view to the previous interface on the line card, or if in line card mode, the previous line card in the chassis. |
| <b>T</b>            | Increase the screen refresh rate.                                                                                           |
| <b>t</b>            | Decrease the screen refresh rate.                                                                                           |
| <b>q</b>            | Return to the CLI prompt.                                                                                                   |

**Example (Single Interface)**

```

## mtu

Set the link maximum transmission unit (MTU) (frame size) for an Ethernet interface.

### S4820T

#### Syntax

```
mtu value
```

To return to the default MTU value, use the `no mtu` command.

#### Parameters

***value***

Enter a maximum frame size in bytes. The range is from 594 to 12000 for the S4820T. The default is **1554**.

#### Defaults

**1554**

#### Command Modes

INTERFACE

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version                | Description                          |
|------------------------|--------------------------------------|
| 9.7(0.0)               | Introduced on the S6000-ON.          |
| 9.0.2.0                | Introduced on the S6000.             |
| 8.3.19.0               | Introduced on the S4820T.            |
| 8.3.11.1               | Introduced on the Z9000.             |
| 8.3.7.0                | Introduced on the S4810.             |
| 8.1.1.0                | Introduced on the E-Series ExaScale. |
| 7.5.1.0                | Introduced on the C-Series.          |
| pre-Version<br>6.2.1.0 | Introduced on the E-Series.          |

### Usage Information

If the packet includes a Layer 2 header, the difference between the link MTU and IP MTU (`ip mtu` command) must be enough bytes to include the Layer 2 header.

When you enter the `no mtu` command, Dell Networking OS reduces the IP MTU value to 1536 bytes.

Link MTU and IP MTU considerations for port channels and VLANs are as follows.

#### port channels:

- All members must have the same link MTU value and the same IP MTU value.
- The port channel link MTU and IP MTU must be less than or equal to the link MTU and IP MTU values configured on the channel members. For example, if the members have a link MTU of 2100 and an IP MTU 2000, the port channel's MTU values cannot be higher than 2100 for link MTU or 2000 bytes for IP MTU.

#### VLANs:

- All members of a VLAN must have same IP MTU value.
- Members can have different Link MTU values. Tagged members must have a link MTU 4 bytes higher than untagged members to account for the packet tag.
- The VLAN link MTU and IP MTU must be less than or equal to the link MTU and IP MTU values configured on the VLAN members. For example, the VLAN contains tagged members with Link MTU of 1522 and IP MTU of 1500 and untagged members with Link MTU of 1518 and IP MTU of 1500. The VLAN's Link MTU cannot be higher than 1518 bytes and its IP MTU cannot be higher than 1500 bytes.

The following shows the difference between Link MTU and IP MTU.

| Layer 2 Overhead       | Link MTU and IP MTU Delta |
|------------------------|---------------------------|
| Ethernet<br>(untagged) | 18 bytes                  |
| VLAN Tag               | 22 bytes                  |

|                                               |                                  |
|-----------------------------------------------|----------------------------------|
| <b>Layer 2 Overhead</b>                       | <b>Link MTU and IP MTU Delta</b> |
| <b>Untagged Packet with VLAN-Stack Header</b> | 22 bytes                         |
| <b>Tagged Packet with VLAN-Stack Header</b>   | 26 bytes                         |

## portmode hybrid

To accept both tagged and untagged frames, set a physical port or port-channel. A port configured this way is identified as a hybrid port in report displays.

### S4820T

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>portmode hybrid</code><br>To return a port to accept either tagged or untagged frames (non-hybrid), use the <code>no portmode hybrid</code> command.     |
| <b>Defaults</b>        | non-hybrid                                                                                                                                                     |
| <b>Command Modes</b>   | INTERFACE (conf-if-interface-slot/port)                                                                                                                        |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                          |
|----------|--------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.          |
| 9.0.2.0  | Introduced on the S6000.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.3.7.0  | Introduced on the S4810.             |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 7.6.1.0  | Introduced on the S-Series.          |
| 7.5.1.0  | Introduced on the C-Series.          |

|                          |                                                                                                                                                                                                                                                                               |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | The following describes the <code>interface</code> command shown in the following example. This example sets a port as hybrid, makes the port a tagged member of VLAN 20, and an untagged member of VLAN 10, which becomes the native VLAN of the port. The port now accepts: |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- untagged frames and classify them as VLAN 10 frames
- VLAN 20 tagged frames

The following describes the `do show interfaces` command shown in the following example. This example shows output with "Hybrid" as the newly added value for 802.1QTagged. The options for this field are:

- True — port is tagged
- False — port is untagged
- Hybrid — port accepts both tagged and untagged frames

The following describes the `interface vlan` command shown in the following example. This example shows unconfiguration of the hybrid port using the `no portmode hybrid` command.

**NOTE:** Remove all other configurations on the port before you can remove the hybrid configuration from the port.

#### Example

```
Dell(conf)#interface tengigabitethernet 7/1
Dell(conf-if-gi-7/0)#portmode hybrid
Dell(conf-if-gi-7/0)#interface vlan 10
Dell(conf-if-vl-10)#untagged tengigabitethernet 7/1
Dell(conf-if-vl-10)#interface vlan 20
Dell(conf-if-vl-20)#tagged tengigabitethernet 7/1
Dell(conf-if-vl-20)#
```

#### Example

```
Dell(conf-if-vl-20)#do show interfaces switchport
Name: TenGigabitEthernet 7/1
802.1QTagged: Hybrid
Vlan membership:
Vlan 10,    Vlan 20
Native    VlanId: 10
Dell(conf-if-vl-20)#
```

#### Example (Vlan)

```
Dell(conf-if-vl-20)#interface vlan 10
Dell(conf-if-vl-10)#no untagged tengigabitethernet 7/1
Dell(conf-if-vl-10)#interface vlan 20
Dell(conf-if-vl-20)#no tagged tengigabitethernet 7/1
Dell(conf-if-vl-20)#interface tengigabitethernet 7/1
Dell(conf-if-gi-7/0)#no portmode hybrid
Dell(conf-if-vl-20)#
```

## rate-interval

Configure the traffic sampling interval on the selected interface.

### S4820T

#### Syntax

```
rate-interval seconds
```

#### Parameters

##### ***seconds***

Enter the number of seconds for which to collect traffic data. The range is from 5 to 299 seconds.

**NOTE:** Because polling occurs every 15 seconds, the number of seconds designated here rounds to the multiple of 15 seconds lower than the entered value. For example, if 44 seconds is designated, it rounds to 30; 45 to 59 seconds rounds to 45.

**Defaults**                    **299 seconds**

**Command Modes**            INTERFACE

**Command History**            This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                          |
|----------|--------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.          |
| 9.0.2.0  | Introduced on the S6000.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.3.7.0  | Introduced on the S4810.             |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 7.6.1.0  | Introduced on the S-Series.          |
| 7.5.1.0  | Introduced on the C-Series.          |
| 6.1.1.0  | Introduced                           |

**Usage Information**            The output of the `show interfaces` command displays the configured rate interval, along with the collected traffic data.

**Related Commands**            [show interfaces](#) – displays information on physical and virtual interfaces.

## show config

Display the interface configuration.

### S4820T

**Syntax**                        `show config`

**Command Modes**            INTERFACE

**Command History**            This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version                | Description                          |
|------------------------|--------------------------------------|
| 9.0.2.0                | Introduced on the S6000.             |
| 8.3.19.0               | Introduced on the S4820T.            |
| 8.3.11.1               | Introduced on the Z9000.             |
| 8.3.7.0                | Introduced on the S4810.             |
| 8.1.1.0                | Introduced on the E-Series ExaScale. |
| 7.6.1.0                | Introduced on the S-Series.          |
| 7.5.1.0                | Introduced on the C-Series.          |
| pre-Version<br>6.2.1.0 | Introduced on the E-Series.          |

#### Example

```
Dell(conf-if-fo-1/4)#show config
!
interface fortyGigE 1/4
 no ip address
 mtu 12000
 switchport
 no shutdown
Dell(conf-if-fo-1/4)#
```

## show config (from INTERFACE RANGE mode)

Display the bulk configured interfaces (`interface range`).

### S4820T

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>show config</code>                                                                                                                                       |
| <b>Command Modes</b>   | CONFIGURATION INTERFACE ( <code>conf-if-range</code> )                                                                                                         |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |

| Version | Description                          |
|---------|--------------------------------------|
| 8.1.1.0 | Introduced on the E-Series ExaScale. |
| 7.6.1.0 | Introduced on the S-Series.          |
| 7.5.1.0 | Introduced on the C-Series.          |
| 6.1.1.0 | Introduced on the E-Series.          |

### Example

```
Dell(conf)#interface range tengigabitethernet 1/1 - 2
Dell(conf-if-range-gi-1/1-2)#show config
!
interface TenGigabitEthernet 1/1
  no ip address
  switchport
  no shutdown
!
interface TenGigabitEthernet 1/2
  no ip address
  switchport
  no shutdown
Dell(conf-if-range-gi-1/1-2)#
```

## show interfaces

Display information on a specific physical interface or virtual interface.

### S4820T

#### Syntax

```
show interfaces interface
```

#### Parameters

##### *interface*

Enter one of the following keywords and slot/port or number information:

- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For stack-units, enter the keywords `stack-unit` then the slot/port information.
- For a Null interface, enter the keyword `null` then the Null interface number.
- For a port channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- For a tunnel interface, enter the keyword `tunnel` then the tunnel ID. The range is from 1 to 16383.

## Command Modes

- EXEC
- EXEC Privilege

## Command History

| Version  | Description                                                                                                                                       |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                                                                                       |
| 9.0.2.0  | Introduced on the S6000.                                                                                                                          |
| 9.2(0.2) | Added support for the tunnel interface type.                                                                                                      |
| 9.1(0.0) | Updated Management Ethernet output to include two global IPv6 addresses on S4810 and Z9000 and added output example showing OpenFlow instance ID. |
| 8.3.12.1 | Updated command output to support multiple IPv6 addresses on S4810.                                                                               |
| 8.3.11.4 | Output expanded to support eSR4 optics in Z9000.                                                                                                  |
| 8.3.11.1 | Introduced on the Z9000.                                                                                                                          |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale.                                                                                              |
| 8.3.7.0  | Introduced on the S4810.                                                                                                                          |
| 8.2.1.2  | Included SFP and SFP+ optics power detail in the E-Series and C-Series output.                                                                    |
| 8.2.1.0  | Added support for 4093 VLANs on the E-Series ExaScale. Prior releases supported 2094.                                                             |
| 8.1.1.0  | Introduced on the E-Series ExaScale.                                                                                                              |
| 7.8.1.0  | Output expanded to include SFP+ media on the C-Series.                                                                                            |
| 7.6.1.0  | Introduced on the S Series.                                                                                                                       |
| 7.5.1.0  | Introduced on the C-Series.                                                                                                                       |
| 6.4.1.0  | Changed the organization of the display output.                                                                                                   |
| 6.3.1.0  | Added the Pluggable Media Type field in the E-Series TeraScale output.                                                                            |

## Usage Information

Use the `show interfaces` command for details on a specific interface.

**NOTE:** In the CLI output, the power value is rounded to a 3-digit value. For receive/transmit power that is less than 0.000, an `snmp query` returns the corresponding dbm value even though the CLI displays as 0.000.

**NOTE:** After the counters are cleared, the line-rate continues to increase until it reaches the maximum line rate. When the maximum line rate is reached, there is no change in the line-rate.

## User Information

The following table describes the `show interfaces` command shown in the 10G (TeraScale) Example.

| Line                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| TenGigabitEthernet 1/1...  | Interface type, slot/port, and administrative and line protocol status.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Hardware is...             | Interface hardware information, assigned MAC address, and current address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Pluggable media present... | <p>Present pluggable media wavelength, type, and rate. The error scenarios are:</p> <ul style="list-style-type: none"> <li>• Wavelength, Non-qualified — Dell Force10 ID is not present, but wavelength information is available from XFP or SFP serial data</li> <li>• Wavelength, F10 unknown — Dell Force10 ID is present, but not able to determine the optics type</li> <li>• Unknown, Non-qualified — if wavelength is reading error, and F10 ID is not present</li> </ul> <p>Dell Networking allows unsupported SFP and XFP transceivers to be used, but Dell Networking OS might not be able to retrieve some data about them. In that case, typically when the output of this field is "Pluggable media present, Media type is unknown", the Medium and the XFP/SFP receive power reading data might not be present in the output.</p> |
| Interface index...         | Displays the interface index number the SNMP uses to identify the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Internet address...        | States whether an IP address is assigned to the interface. If an IP address is assigned, that address is displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| MTU 1554...                | Displays link and IP MTU information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| LineSpeed                  | Displays the interface's line speed, duplex mode, and negotiation mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| ARP type:...               | Displays the ARP type and the ARP timeout value for the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Last clearing...           | Displays the time when the <code>show interfaces</code> counters were cleared.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Queuing strategy...        | States the packet queuing strategy. FIFO means first in first out.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Output Statistics:</b> | <p>Displays output statistics sent out of the interface including:</p> <ul style="list-style-type: none"> <li>• Number of packets, bytes, and underruns out of the interface</li> <li>• Packet size and the number of the packets outbound to the interface</li> <li>• Number of Multicast, Broadcast, and Unicast packets: <ul style="list-style-type: none"> <li>- Multicasts = number of MAC multicast packets</li> <li>- Broadcasts = number of MAC broadcast packets</li> <li>- Unicasts = number of MAC unicast packets</li> </ul> </li> <li>• Number of VLANs, throttles, discards, and collisions: <ul style="list-style-type: none"> <li>- Vlans = number of VLAN tagged packets</li> <li>- throttles = packets containing PAUSE frames</li> <li>- discarded = number of packets discarded without any processing</li> <li>- collisions = number of packet collisions</li> <li>- wred=count both packets discarded in the MAC and in the hardware-based queues</li> </ul> </li> </ul> |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Rate information...** Estimate of the input and output traffic rate over a designated interval (30 to 299 seconds). Traffic rate is displayed in bits, packets per second, and percent of line rate.

**Time since...** Elapsed time since the last interface status change (hh:mm:ss format).

**Example**

```
Dell#show interfaces
TenGigabitEthernet 2/1 is down, line protocol is down
Hardware is DellForce10Eth, address is 00:01:e8:8b:3d:e7
Current address is 00:01:e8:8b:3d:e7
Pluggable media present, Media type is unknown
Wavelength unknown
Interface index is 100992002
Internet address is not set
```

```

MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed auto
Flowcontrol rx on tx off
ARP type: ARPA, ARP Timeout 04:00:00
Last clearing of "show interface" counters 3d17h53m
Queueing strategy: fifo
Input Statistics:
  0 packets, 0 bytes
  0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
  0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte
pkts
  0 Multicasts, 0 Broadcasts
  0 runts, 0 giants, 0 throttles
  0 CRC, 0 overrun, 0 discarded
Output Statistics:
  0 packets, 0 bytes, 0 underruns
  0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
  0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte
pkts
  0 Multicasts, 0 Broadcasts, 0 Unicasts
  0 throttles, 0 discarded, 0 collisions, 0 wreddrops
Rate info (interval 299 seconds):
  Input 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate
  Output 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate
Time since last interface status change: 3d17h51m

```

#### Usage Information

The Management port is enabled by default (no shutdown). If necessary, use the `ip address` command to assign an IP address to the Management port. If two RPMs are installed in your system, use the `show redundancy` command to display which RPM is the Primary RPM.

#### Example (1G SFP)

```

Dell#show interfaces tengigabitethernet 2/1
TenGigabitEthernet 2/1 is up, line protocol is down
Hardware is Force10Eth, address is 00:01:e8:41:77:95
  Current address is 00:01:e8:41:77:95
Pluggable media present, SFP type is 1000BASE-SX
  Wavelength is 850nm
Interface index is 100974648
Port will not be disabled on partial SFM failure
Internet address is not set
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed 1000 Mbit
Flowcontrol rx on tx on
ARP type: ARPA, ARP Timeout 04:00:00
Last clearing of "show interface" counters 1w0d5h
Queueing strategy: fifo
Input Statistics:
  0 packets, 0 bytes
  0 Vlans
  0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
  0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte
pkts
  0 Multicasts, 0 Broadcasts
  0 runts, 0 giants, 0 throttles
  0 CRC, 0 overrun, 0 discarded
Output Statistics:
  0 packets, 0 bytes, 0 underruns
  0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
  0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte
pkts
  0 Multicasts, 0 Broadcasts, 0 Unicasts

```

```
0 Vlans, 0 throttles, 0 discarded, 0 collisions, 0 wreddrops
Rate info (interval 299 seconds):
  Input 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate
  Output 00.00 Mbits/sec, 0 packets/sec,0.00% of line-rate
Time since last interface status change: 1w0d5h
Dell#
```

**Example  
(Management  
Ethernet)**

```
Dell#show interfaces managementethernet 0/0

ManagementEthernet 0/0 is up, line protocol is up
Hardware is Forcel0Eth, address is 00:01:e8:0b:a9:4c
  Current address is 00:01:e8:0b:a9:4c
Pluggable media not present
Interface index is 503595208
Internet address is 10.11.201.5/16
Link local IPv6 address: fe80::201:e8ff:fe0b:a94c/64
Global IPv6 address: 2222::5/64
Virtual-IP is not set
Virtual-IP IPv6 address is not set
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed 10 Mbit, Mode half duplex
ARP type: ARPA, ARP Timeout 04:00:00
Last clearing of "show interface" counters 04:01:08
Queueing strategy: fifo
  Input 943 packets, 78347 bytes, 190 multicast
  Received 0 errors, 0 discarded
  Output 459 packets, 102388 bytes, 15 multicast
  Output 0 errors, 0 invalid protocol
Time since last interface status change: 00:03:09
```

**Example  
(Management  
Ethernet, two  
IPv6 addresses)**

```
Dell#show interfaces managementethernet 0/0

ManagementEthernet 0/0 is up, line protocol is up

Hardware is DellForcel0Eth, address is 00:01:e8:a0:bf:f3

Current address is 00:01:e8:a0:bf:f3

Pluggable media not present

Interface index is 302006472

Internet address is 10.16.130.5/16

Link local IPv6 address: fe80::201:e8ff:fea0:bf3/64

Global IPv6 address: 1::1/

Global IPv6 address: 2::1/64

Virtual-IP is not set

Virtual-IP IPv6 address is not set

MTU 1554 bytes, IP MTU 1500 bytes

LineSpeed 1000 Mbit, Mode full duplex
```

```
ARP type: ARPA, ARP Timeout 04:00:00

Last clearing of "show interface" counters 00:06:14

Queueing strategy: fifo

Input 791 packets, 62913 bytes, 775 multicast

Received 0 errors, 0 discarded

Output 21 packets, 3300 bytes, 20 multicast

Output 0 errors, 0 invalid protocol

Time since last interface status change: 00:06:03
```

**Example  
(OpenFlow  
instance)**

```
Dell#show interfaces vlan 6

Vlan 6 is down, line protocol is down

Address is 00:01:e8:8a:e1:8c, Current address is
00:01:e8:8a:e1:8c

Interface index is 1107525638

of-instance: 2

Internet address is not set

MTU 1554 bytes, IP MTU 1500 bytes

LineSpeed auto

ARP type: ARPA, ARP Timeout 04:00:00

Last clearing of "show interface" counters 00:05:12

Queueing strategy: fifo

Time since last interface status change: 00:05:12
```

**Related  
Commands**

[show interfaces configured](#) – displays any interface with a non-default configuration.

[show inventory \(S-Series and Z-Series\)](#) – displays the S-Series and Z-Series switch types, components (including media), Dell Networking OS version including hardware identification numbers, and configured protocols.

[show range](#) – displays all interfaces configured using the interface range command.

## show interfaces configured

Display any interface with a non-default configuration.

### S4820T

**Syntax** show interfaces configured

**Command Modes**

- EXEC
- EXEC Privilege

| Command History | Version  | Description                                     |
|-----------------|----------|-------------------------------------------------|
|                 | 9.7(0.0) | Introduced on the S6000-ON.                     |
|                 | 9.0.2.0  | Introduced on the S6000.                        |
|                 | 8.3.19.0 | Introduced on the S4820T.                       |
|                 | 8.3.11.1 | Introduced on the Z9000.                        |
|                 | 8.3.7.0  | Introduced on the S4810.                        |
|                 | 8.1.1.0  | Introduced on the E-Series ExaScale.            |
|                 | 7.6.1.0  | Introduced on the S-Series.                     |
|                 | 7.5.1.0  | Introduced on the C-Series.                     |
|                 | 6.4.1.0  | Changed the organization of the display output. |

### Example

```
Dell#show interfaces configured
TenGigabitEthernet 13/18 is up, line protocol is up
Hardware is Force10Eth, address is 00:01:e8:05:f7:fc
Current address is 00:01:e8:05:f7:fc
Interface index is 474791997
Internet address is 1.1.1.1/24
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed 1000 Mbit, Mode full duplex, Master
ARP type: ARPA, ARP Timeout 04:00:00
Last clearing of "show interfaces" counters 00:12:42
Queueing strategy: fifo
Input Statistics:
  10 packets, 10000 bytes
  0 Vlans
  0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
  0 over 255-byte pkts, 10 over 511-byte pkts, 0 over 1023-
byte pkts
  0 Multicasts, 0 Broadcasts
  0 runs, 0 giants, 0 throttles
  0 CRC, 0 overrun, 0 discarded
Output Statistics:
  1 packets, 64 bytes, 0 underruns
  1 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
  0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte
pkts
  0 Multicasts, 1 Broadcasts, 0 Unicasts
  0 Vlans, 0 throttles, 0 discarded, 0 collisions
```

```

Rate info (interval 299 seconds):
  Input 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate
  Output 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate
Time since last interface status change: 00:04:59
Dell#

```

**Related Commands**      [show interfaces](#) — displays information on a specific physical interface or virtual interface.

## show interfaces dampening

Display interface dampening information.

### S4820T

**Syntax**                    `show interfaces dampening [[interface] [summary] [detail]]`

#### Parameters

- |                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>interface</i></b> | (Optional) Enter one of the following keywords and slot/port or number information: <ul style="list-style-type: none"> <li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> </ul> |
| <b>summary</b>          | (OPTIONAL) Enter the keyword <code>summary</code> to display the current summary of dampening data, including the number of interfaces configured and the number of interfaces suppressed, if any.                                                                                                                                                                                                                                                                                                                       |
| <b>detail</b>           | (OPTIONAL) Enter the keyword <code>detail</code> to display detailed interface dampening data.                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Defaults**                    none

**Command Modes**            EXEC

**Command History**            This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |

| Version | Description                                          |
|---------|------------------------------------------------------|
| 8.3.7.0 | Introduced on the S4810.                             |
| 8.5.1.0 | Added support for 4-port 40G line cards on ExaScale. |
| 8.1.1.0 | Introduced on the E-Series ExaScale.                 |
| 7.6.1.0 | Introduced on the S-Series.                          |
| 7.5.1.0 | Introduced on the C-Series.                          |
| 7.4.1.0 | Introduced                                           |

#### Example

```
Dell#show interfaces dampening
Interface Supp   Flaps Penalty Half-Life Reuse Suppress Max-Sup
          State
Te 3/2    Up    0    0        20      800   4500   120
Te 3/10   Up    0    0         5      750   2500   20
Dell#
```

#### Related Commands

[dampening](#) — configures dampening on an interface.

[show interfaces](#) — displays information on a specific physical interface or virtual interface.

[show interfaces configured](#) — displays any interface with a non-default configuration.

## show interfaces phy

Display auto-negotiation and link partner information.

### S4820T

#### Syntax

```
show interfaces gigabitethernet slot/port phy
```

#### Parameters

**tengigabitether net** Enter the keyword `tengigabitethernet` then the slot or port information.

#### Command Modes

- EXEC
- EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 8.3.19.0 | Introduced on the S4820T. |

| Version  | Description                              |
|----------|------------------------------------------|
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 8.1.1.0  | Introduced on the E-Series ExaScale.     |
| 7.6.1.0  | Introduced on the C-Series and S-Series. |
| 6.5.4.0  | Introduced on the E-Series.              |

## Usage Information

The following describes the `show interfaces gigabitethernet` command following example.

|                                                 |                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Mode Control</b>                             | Indicates if <code>auto negotiation</code> is enabled. If so, indicates the selected speed and duplex.                                                                                                                                                                                                                            |
| <b>Mode Status</b>                              | Displays auto negotiation fault information. When the interface completes auto negotiation successfully, the <code>autoNegComplete</code> field and the <code>linkstatus</code> field read "True."                                                                                                                                |
| <b>AutoNegotiation Advertise</b>                | Displays the control words the local interface advertises during negotiation. Duplex is either half or full. Asym- and Sym Pause is the types of flow control the local interface supports.                                                                                                                                       |
| <b>AutoNegotiation Remote Partner's Ability</b> | Displays the control words the remote interface advertises during negotiation. Duplex is either half or full. Asym- and Sym Pause is the types of flow control the remote interface supports.                                                                                                                                     |
| <b>AutoNegotiation Expansion</b>                | ParallelDetectionFault is the handshaking scheme in which the link partner continuously transmit an "idle" data packet using the Fast Ethernet MLT-3 waveform. Equipment that does not support auto-negotiation must be configured to exactly match the mode of operation as the link partner or else no link can be established. |
| <b>1000Base-T Control</b>                       | 1000Base-T requires auto-negotiation. The IEEE Ethernet standard does not support setting a speed to 1000 Mbps with the <code>speed</code> command without auto-negotiation. E-Series line cards support both full-duplex and half-duplex 1000BaseT.                                                                              |
| <b>Phy Specific Control</b>                     | Values are: <ul style="list-style-type: none"> <li>• 0 - Manual MDI</li> <li>• 1 - Manual MDIX</li> <li>• 2 - N/A</li> <li>• 3 - Auto MDI/MDIX</li> </ul>                                                                                                                                                                         |
| <b>Phy Specific Status</b>                      | Displays PHY-specific status information. Cable length represents a rough estimate in meters:                                                                                                                                                                                                                                     |

- 0 - < 50 meters
- 1 - 50 - 80 meters
- 2 - 80 - 110 meters
- 3 - 110 - 140 meters
- 4 - 140 meters

Link Status: Up or Down

Speed:

- Auto
- 1000MB
- 100MB
- 10MB

### Example

```
Dell#show interfaces tengigabitethernet 1/0 phy
Mode Control:
  SpeedSelection:      10b
  AutoNeg:             ON
  Loopback:            False
  PowerDown:           False
  Isolate:              False
  DuplexMode:          Full
Mode Status:
  AutoNegComplete:    False
  RemoteFault:         False
  LinkStatus:          False
  JabberDetect:        False
AutoNegotiation Advertise:
  100MegFullDplx:      True
  100MegHalfDplx:      True
  10MegFullDplx:       False
  10MegHalfDplx:       True
  Asym Pause:          False
  Sym Pause:           False
AutoNegotiation Remote Partner's Ability:
  100MegFullDplx:      False
  100MegHalfDplx:      False
  10MegFullDplx:       False
  10MegHalfDplx:       False
  Asym Pause:          False
  Sym Pause:           False
AutoNegotiation Expansion:
  ParallelDetectionFault: False
...
```

### Related Commands

[show interfaces](#) — displays information on a specific physical interface or virtual interface.

## show interfaces stack-unit

Display information on all interfaces on a specific S-Series or Z-Series stack member.

### S4820T

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>show interfaces stack-unit <i>unit-number</i></code>                                                                                                     |
| <b>Parameters</b>      | <b><i>unit-number</i></b> Enter the stack member number. The range is from 0 to 11 for the S4820T.                                                             |
| <b>Command Modes</b>   | <ul style="list-style-type: none"><li>EXEC</li><li>EXEC Privilege</li></ul>                                                                                    |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |

### Example

```
Dell#show interfaces stack-unit 1
TenGigabitEthernet 1/1 is down, line protocol is down
Hardware is Force10Eth, address is 00:01:e8:4c:f2:82
  Current address is 00:01:e8:4c:f2:82
Pluggable media not present
Interface index is 34129154
Internet address is not set
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed auto, Mode auto
ARP type: ARPA, ARP Timeout 04:00:00
Last clearing of "show interface" counters 3w0d17h
Queueing strategy: fifo
Input Statistics:
  0 packets, 0 bytes
  5144 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
  0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte
pkts
  0 Multicasts, 0 Broadcasts
  0 runts, 0 giants, 0 throttles
  0 CRC, 0 overrun, 0 discarded
Output Statistics:
  0 packets, 0 bytes, 0 underruns
  0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
```

```

    0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte
pkts
    0 Multicasts, 0 Broadcasts, 0 Unicasts
    0 throttles, 0 discarded, 0 collisions
Rate info (interval 299 seconds):
    Input 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate
    Output 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate
Time since last interface status change: 3w0d17h
    TenGigabitEthernet 1/2 is down, line protocol is down
Hardware is Force10Eth, address is 00:01:e8:4c:f2:83
    Current address is 00:01:e8:4c:f2:83
!-----output truncated -----!

```

**Related  
Commands**

[show hardware stack-unit](#) — displays data plane and management plane input/output statistics.

[show interfaces](#) — displays information on a specific physical interface or virtual interface.

## show interfaces status

To display status information on a specific interface only, display a summary of interface information or specify a stack-unit slot and interface.

### S4820T

**Syntax**

`show interfaces [interface status`

**Parameters**

***interface***

(OPTIONAL) Enter one of the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then the slot/port information. The range is from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.

**Defaults**

none

**Command  
Modes**

- EXEC
- EXEC Privilege

**Command  
History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                          |
|----------|------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                          |
| 9.0.2.0  | Introduced on the S6000.                             |
| 8.3.19.0 | Introduced on the S4820T.                            |
| 8.3.11.1 | Introduced on the Z9000.                             |
| 8.3.7.0  | Introduced on the S4810.                             |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale. |
| 8.1.1.0  | Introduced on the E-Series ExaScale.                 |
| 7.6.1.0  | Introduced on the S-Series.                          |
| 7.5.1.0  | Introduced on the C-Series.                          |
| 7.5.1.0  | Introduced on the E-Series.                          |

#### Example

```
Dell#show interfaces status
Port      Description      Status      Speed      Duplex      Vlan
Te 1/1
Te 1/2
Te 1/3
Te 1/4
Te 1/5      DellPort        Up          1000 Mbit  Auto        30-130
Te 1/6
Te 1/7
Te 1/8
1502,1504,1506-1508,1602
Te 1/9
Te 1/10

Te 1/12
Te 1/13
Te 1/14
Te 1/15
Te 1/16
Dell#
```

**Related Commands**      [show interfaces](#) — displays information on a specific physical interface or virtual interface.

## show interfaces switchport

Display only virtual and physical interfaces in Layer 2 mode. This command displays the Layer 2 mode interfaces' IEEE 802.1Q tag status and VLAN membership.

### S4820T

**Syntax**                    `show interfaces switchport [interface | stack-unit unit-id ]`

**Parameters**                *interface*                    (OPTIONAL) Enter one of the following keywords and slot/port or number information:

- For a port channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a backup interface for this interface, enter the keyword `backup`.

**stack-unit *unit-id*** (OPTIONAL) Enter the keywords `stack-unit` then the stack member number. This option is available only on S-Series. The range is from 0 to 5.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                            |
|----------|------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                            |
| 9.0.2.0  | Introduced on the S6000.                                               |
| 8.3.19.0 | Introduced on the S4820T.                                              |
| 8.3.11.1 | Introduced on the Z9000.                                               |
| 8.3.7.0  | Introduced on the S4810.                                               |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale.                   |
| 8.2.1.0  | Added support for 4093 VLANs on E-Series ExaScale.                     |
| 8.1.1.0  | Introduced on the E-Series ExaScale.                                   |
| 7.6.1.0  | Support added for hybrid port/native VLAN, introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series.                                            |

**E-Series legacy command**

**Usage Information**

The following describes the `show interfaces switchport` command for the following example.

| Items | Description                                      |
|-------|--------------------------------------------------|
| Name  | Displays the interface's type, slot/port number. |

| Items                  | Description                                                                                                                                                     |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>802.1QTagged</b>    | Displays whether if the VLAN tagged ("True"), untagged ("False"), or hybrid ("Hybrid"), which supports both untagged and tagged VLANs by port 13/0.             |
| <b>Vlan membership</b> | Lists the VLANs to which the interface is a member. Starting with Dell Networking OS version 7.6.1, this field can display native VLAN membership by port 13/0. |

### Example

```
Dell#show interfaces switchport
Name: TenGigabitEthernet 13/1
802.1QTagged: Hybrid
Vlan membership:
Vlan 2, Vlan 20
Native VlanId: 20

Name: TenGigabitEthernet 13/2
802.1QTagged: True
Vlan membership:
Vlan 2

Name: TenGigabitEthernet 13/3
802.1QTagged: True
Vlan membership:
Vlan 2

Name: TenGigabitEthernet 13/4
802.1QTagged: True
Vlan membership:
Vlan 2
--More--
```

### Related Commands

[interface](#) — configures a physical interface on the switch.

[show ip interface](#) — displays Layer 3 information about the interfaces.

[show interfaces](#) — displays information on a specific physical interface or virtual interface.

[show interfaces transceiver](#) — displays the physical status and operational status of an installed transceiver. The output also displays the transceiver's serial number.

## show interfaces transceiver

Display the physical status and operational status of an installed transceiver. The output also displays the transceiver's serial number.

### S4820T

#### Syntax

```
show interfaces [tengigabitethernet slot/port | fortyGigE slot/
port] transceiver
```

## Parameters

|                            |                                                                                                                        |
|----------------------------|------------------------------------------------------------------------------------------------------------------------|
| <b>tengigabitether net</b> | For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information. |
| <b>fortyGigE</b>           | For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.          |

## Command Modes

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                 |
|----------|-----------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                 |
| 9.0.2.0  | Introduced on the S6000.                                                    |
| 8.3.19.0 | Introduced on the S4820T.                                                   |
| 8.3.11.1 | Introduced on the Z9000.                                                    |
| 8.3.7.0  | Introduced on the S4810.                                                    |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale.                        |
| 8.1.1.0  | Introduced on the E-Series ExaScale.                                        |
| 7.8.1.0  | Output augmented with diagnostic data for pluggable media.                  |
| 7.7.1.0  | Removed three fields in the output: Vendor Name, Vendor OUI, and Vendor PN. |
| 7.6.1.0  | Introduced on the C-Series and S-Series.                                    |
| 6.5.4.0  | Introduced on the E-Series.                                                 |

## Usage Information

The following describes the `show interfaces transceiver` command shown in the following example.

| Line                                | Description                                                                                                |
|-------------------------------------|------------------------------------------------------------------------------------------------------------|
| <b>Rx Power measurement type</b>    | Output depends on the vendor, typically either "Average" or "OMA" (Receiver optical modulation amplitude). |
| <b>Temp High Alarm threshold</b>    | Factory-defined setting, typically in Centigrade. Value differs between SFPs and SFP+.                     |
| <b>Voltage High Alarm threshold</b> | Displays the interface index number used by SNMP to identify the interface.                                |

| <b>Line</b>                            | <b>Description</b>                                                                                                                                       |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Bias High Alarm threshold</b>       | Factory-defined setting. Value can differ between SFP and SFP+.                                                                                          |
| <b>TX Power High Alarm threshold</b>   | Factory-defined setting. Value can differ between SFP and SFP+.                                                                                          |
| <b>RX Power High Alarm threshold</b>   | Factory-defined setting. Value can differ between SFP and SFP+.                                                                                          |
| <b>Temp Low Alarm threshold</b>        | Factory-defined setting. Value can differ between SFP and SFP+.                                                                                          |
| <b>Voltage Low Alarm threshold</b>     | Factory-defined setting. Value can differ between SFP and SFP+.                                                                                          |
| <b>Bias Low Alarm threshold</b>        | Factory-defined setting. Value can differ between SFP and SFP+.                                                                                          |
| <b>TX Power Low Alarm threshold</b>    | Factory-defined setting. Value can differ between SFP and SFP+.                                                                                          |
| <b>RX Power Low Alarm threshold</b>    | Factory-defined setting. Value can differ between SFP and SFP+.                                                                                          |
| <b>Temp High Warning threshold</b>     | Factory-defined setting. Value can differ between SFP and SFP+.                                                                                          |
| <b>Voltage High Warning threshold</b>  | Factory-defined setting. Value can differ between SFP and SFP+.                                                                                          |
| <b>Bias High Warning threshold</b>     | Factory-defined setting. Value can differ between SFP and SFP+.                                                                                          |
| <b>TX Power High Warning threshold</b> | Factory-defined setting. Value can differ between SFP and SFP+.                                                                                          |
| <b>RX Power High Warning threshold</b> | Factory-defined setting. Value can differ between SFP and SFP+.                                                                                          |
| <b>Temp Low Warning threshold</b>      | Factory-defined setting. Value can differ between SFP and SFP+.                                                                                          |
| <b>Voltage Low Warning threshold</b>   | Factory-defined setting. Value can differ between SFP and SFP+.                                                                                          |
| <b>Bias Low Warning threshold</b>      | Factory-defined setting. Value can differ between SFP and SFP+.                                                                                          |
| <b>TX Power Low Warning threshold</b>  | Factory-defined setting. Value can differ between SFP and SFP+.                                                                                          |
| <b>Power Low Warning threshold</b>     | Factory-defined setting. Value can differ between SFP and SFP+.                                                                                          |
| <b>Temperature</b>                     | Current temperature of the SFPs. If this temperature crosses Temp High alarm/warning thresholds, the temperature high alarm/warning flag is set to true. |

| <b>Line</b>                        | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Voltage</b>                     | Current voltage of the SFPs. If this voltage crosses voltage high alarm/warning thresholds, the voltage high alarm/warning flag is set to true.                                                                                                                                                                                                                       |
| <b>Tx Bias Current</b>             | Present transmission (Tx) bias current of the SFP. If this crosses bias high alarm/warning thresholds, the TX bias high alarm/warning flag is set to true. If it falls below the low alarm/warning thresholds, the TX bias low alarm/warning flag is set to true.                                                                                                     |
| <b>Tx Power</b>                    | Present Tx power of the SFP. If this crosses Tx power alarm/warning thresholds, the Tx power high alarm/warning flag is set to true. If it falls below the low alarm/warning thresholds, the Tx power low alarm/warning flag is set to true.                                                                                                                          |
| <b>Rx Power</b>                    | Present receiving (Rx) power of the SFP. This value is either average Rx power or OMA. This depends on the Rx Power measurement type displayed above. If this crosses Rx power alarm/warning thresholds, the Rx power high alarm/warning flag is set to true. If it falls below the low alarm/warning thresholds, the Rx power low alarm/warning flag is set to true. |
| <b>Data Ready state Bar</b>        | This field indicates that the transceiver has achieved power up and data is ready. This is set to true if data is ready to be sent and set to false if data is being transmitted.                                                                                                                                                                                     |
| <b>Rx LOS state</b>                | This is the digital state of the Rx_LOS output pin. This is set to true if the operating status is down.                                                                                                                                                                                                                                                              |
| <b>Tx Fault state</b>              | This is the digital state of the Tx Fault output pin.                                                                                                                                                                                                                                                                                                                 |
| <b>Rate Select state</b>           | This is the digital state of the SFP rate_select input pin.                                                                                                                                                                                                                                                                                                           |
| <b>RS state</b>                    | This is the reserved digital state of the pin AS(1) per SFF-8079 and RS(1) per SFF-8431.                                                                                                                                                                                                                                                                              |
| <b>Tx Disable state</b>            | If the admin status of the port is down then this flag is set to true.                                                                                                                                                                                                                                                                                                |
| <b>Temperature High Alarm Flag</b> | This can be either true or false, depending on the Current voltage value displayed above.                                                                                                                                                                                                                                                                             |
| <b>Voltage High Alarm Flag</b>     | This can be either true or false, depending on the Current Temperature value displayed above.                                                                                                                                                                                                                                                                         |
| <b>Tx Bias High Alarm Flag</b>     | This can be either true or false, depending on the present Tx bias current value displayed above.                                                                                                                                                                                                                                                                     |
| <b>Tx Power High Alarm Flag</b>    | This can be either true or false, depending on the Current Tx bias power value displayed above.                                                                                                                                                                                                                                                                       |
| <b>Rx Power High Alarm Flag</b>    | This can be either true or false, depending on the Current Rx power value displayed above.                                                                                                                                                                                                                                                                            |

| Line                          | Description                                                                                       |
|-------------------------------|---------------------------------------------------------------------------------------------------|
| Temperature Low Alarm Flag    | This can be either true or false, depending on the Current Temperature value displayed above.     |
| Voltage Low Alarm Flag        | This can be either true or false, depending on the Current voltage value displayed above.         |
| Tx Bias Low Alarm Flag        | This can be either true or false, depending on the Tx bias current value displayed above.         |
| Tx Power Low Alarm Flag       | This can be either true or false, depending on the Current Tx power value displayed above.        |
| Rx Power Low Alarm Flag       | This can be either true or false, depending on the Current Rx power value displayed above.        |
| Temperature High Warning Flag | This can be either true or false, depending on the Current Temperature value displayed above.     |
| Voltage High Warning Flag     | This can be either true or false, depending on the Current Voltage value displayed above.         |
| Tx Bias High Warning Flag     | This can be either true or false, depending on the Tx bias current value displayed above.         |
| Tx Power High Warning Flag    | This can be either true or false, depending on the Current Tx power value displayed above.        |
| Rx Power High Warning Flag    | This can be either true or false, depending on the Current Rx power value displayed above.        |
| Temperature Low Warning Flag  | This can be either true or false, depending on the Current Temperature value displayed above.     |
| Voltage Low Warning Flag      | This can be either true or false, depending on the Current Voltage value displayed above.         |
| Tx Bias Low Warning Flag      | This can be either true or false, depending on the present Tx bias current value displayed above. |
| Tx Power Low Warning Flag     | This can be either true or false, depending on the Current Tx power value displayed above.        |
| Rx Power Low Warning Flag     | This can be either true or false, depending on the Current Rx power value displayed above.        |

### Example

```

Dell#show interfaces TengigabitEthernet 1/1 transceiver
SFP is present.

SFP 0 Serial Base ID fields
SFP 0 Id = 0x03

**Related  
Commands**

[interface](#) — configures a physical interface on the switch.

[show ip interface](#) — displays Layer 3 information about the interfaces.

[show interfaces](#) — displays information on a specific physical interface or virtual interface.

[show inventory \(S-Series and Z-Series\)](#) — displays the switch type, components (including media), Dell Networking OS version including hardware identification numbers and configured protocols.

## show interfaces vlan

Display VLAN statistics.

### S4820T

**Syntax**

```
show interfaces vlan {vlan-id} [LINE] {description}
```

**Parameters**

|                    |                                                               |
|--------------------|---------------------------------------------------------------|
| <b>vlan-id</b>     | Enter the interface VLAN number. The range is from 1 to 4094. |
| <b>LINE</b>        | (OPTIONAL) Enter the name of the VLAN.                        |
| <b>description</b> | Displays the VLAN interface information with description.     |

**Command  
Modes**

- EXEC
- EXEC Privilege

**Command  
History**

| Version  | Description                              |
|----------|------------------------------------------|
| 9.7(0.0) | Introduced on the S-Series and Z-Series. |

**Example**

```
Dell#show interfaces vlan 10  
Vlan 10 is up, line protocol is down  
Address is 90:b1:1c:f4:99:ce, Current address is  
90:b1:1c:f4:99:ce  
Interface index is 1107787786  
Internet address is not set  
Mode of IPv4 Address Assignment: NONE  
DHCP Client-ID: 90b11cf499ce  
MTU 1554 bytes, IP MTU 1500 bytes  
LineSpeed auto  
ARP type: ARPA, ARP Timeout 04:00:00  
Last clearing of "show interface" counters 2d17h26m  
Queueing strategy: fifo  
Time since last interface status change: 2d17h26m  
Input Statistics:  
    0 packets, 0 bytes
```

```
Output Statistics:
  0 packets, 0 bytes, 0 underruns
```

**Related Commands** [show interfaces](#) — displays information on a specific physical interface or virtual interface.

## show range

Display all interfaces configured using the `interface range` command.

### S4820T

**Syntax** `show range`

**Command Modes** INTERFACE RANGE (config-if-range)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                        |
| 9.0.2.0  | Introduced on the S6000.                           |
| 8.3.19.0 | Introduced on the S4820T.                          |
| 8.3.11.1 | Introduced on the Z9000.                           |
| 8.3.7.0  | Introduced on the S4810.                           |
| 8.2.1.0  | Added support for 4093 VLANs on E-Series ExaScale. |
| 8.1.1.0  | Introduced on the E-Series ExaScale.               |
| 7.6.1.0  | Introduced on the S-Series.                        |
| 7.5.1.0  | Introduced on the C-Series.                        |
| 6.1.1.0  | Introduced.                                        |

**Example**

```
Dell (conf-if-range-te-2/2, fo-2/56) #show range
2/2 - 0
2/56 - 0
Dell (conf-if-range-te-2/2, fo-2/56) #
```

**Related Commands** [interface](#) — configures a physical interface on the switch.

[show ip interface](#) — displays Layer 3 information about the interfaces.

[show interfaces](#) — displays information on a specific physical interface or virtual interface.

## show running-config ecmp-group

Display interfaces, LAG, or LAG link bundles being monitored for uneven traffic distribution using the `ecmp-group monitoring enable` command. The ECMP group could have a LAG or a list of 10G/40 interfaces (not just LAG link-bundles).

### S4820T

**Syntax** `show running-config ecmp-group`

**Defaults** Disabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.10.0 | Introduced on the S4810.    |

**Related Commands** [ecmp-group](#) — configures a mechanism to monitor traffic distribution.

## shutdown

Disable an interface.

### S4820T

**Syntax** `shutdown`  
To activate an interface, use the `no shutdown` command.

**Defaults** The interface is disabled.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                          |
|----------|--------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.          |
| 9.0.2.0  | Introduced on the S6000.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.3.7.0  | Introduced on the S4810.             |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 7.6.1.0  | Introduced on the S-Series.          |
| 7.5.1.0  | Introduced on the C-Series.          |

#### E-Series legacy command

#### Usage Information

The `shutdown` command marks a physical interface as unavailable for traffic. To discover if an interface is disabled, use the `show ip interface brief` command. Disabled interfaces are listed as down.

Disabling a VLAN or a port channel causes different behavior. When a VLAN is disabled, the Layer 3 functions within that VLAN are disabled. Layer 2 traffic continues to flow. Entering the `shutdown` command on a port channel disables all traffic on the port channel and the individual interfaces within the port channel. To enable a port channel, enter `no shutdown` on the port channel interface and at least one interface within that port channel.

The `shutdown` and `description` commands are the only commands that you can configure on an interface that is a member of a port channel.

#### Related Commands

[interface port-channel](#) — creates a port channel interface.

[interface vlan](#) — creates a VLAN.

[show ip interface](#) — displays the interface routing status. Add the keyword `brief` to display a table of interfaces and their status.

### speed (for 10/100/1000 interfaces)

Set the speed for 10/100/1000 Base-T Ethernet interfaces. Set both sides of a link to the same speed (10/100/1000) or to auto or the link may not come up.

#### S4820T

##### Syntax

```
speed {10 | 100 | 1000 | auto}
```

To return to the default setting, use the `no speed {10 | 100 | 1000}` command.

## Parameters

|             |                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**E-Series legacy command**

## Usage Information

This command is found on the 10/100/1000 Base-T Ethernet interfaces.

When you enable `auto`, the system performs an automatic discovery to determine the optics installed and configure the appropriate speed.

When you configure a speed for the 10/100/1000 interface, confirm the negotiation `auto` command setting. Both sides of the link must have auto-negotiation either enabled or disabled. For speed settings of 1000 or `auto`, the software sets the link to auto-negotiation and you cannot change that setting.

**NOTE:** Starting with Dell Networking OS version 7.8.1.0, when you use a copper SFP2 module with catalog number GP-SFP2-1T in the S25P model of the S-Series, you can manually set its speed with the `speed` command. When you set the speed to **10** or **100 Mbps**, you can also use the `duplex` command.

## Related Commands

[duplex \(10/100 Interfaces\)](#) – configures duplex mode on physical interfaces with the speed set to 10/100.

[negotiation auto](#) – enables or disables auto-negotiation on an interface.

## speed (Management interface)

Set the speed for the Management interface.

### S4820T

#### Syntax

```
speed {10 | 100 | 1000 | auto}
```

To return to the default setting, use the `no speed` command.

#### Parameters

|             |                                                                                       |
|-------------|---------------------------------------------------------------------------------------|
| <b>10</b>   | Enter the keyword <code>10</code> to set the interface's speed to 10 Mb/s.            |

[management route](#) — configures a static route that points to the Management interface or a forwarding router.

## stack-unit portmode

You can split a single 40G port into four-10G ports.

### S4820T

#### Syntax

```
stack-unit stack-unit port number portmode quad
```

#### Parameters

|                          |                                                                                                                 |
|--------------------------|-----------------------------------------------------------------------------------------------------------------|
| <b><i>stack-unit</i></b> | Enter the stack member unit identifier of the stack member to reset. For the S4820T, the range is from 0 to 11. |
| <b><i>number</i></b>     | Enter the port number of the 40G port to be split. Enter one of the following port numbers: 48, 52, 56, or 60.  |

#### Defaults

Disabled.

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                   |
|----------|-----------------------------------------------------------------------------------------------|
| 9.7(0.0) | Added support for dynamically fanning-out of interfaces on S6000. Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.                                                                      |
| 8.3.19.0 | Introduced on the S4820T.                                                                     |
| 8.3.11.1 | Introduced on the Z9000.                                                                      |
| 8.3.7.1  | Introduced on the S4810.                                                                      |

### Usage Information

Splitting a 40G port into 4x10G port is supported on standalone and stacked units. `stack-unit stack-unit port number portmode quad` dynamically fan-out 40G ports to 10G ports and vice-versa without reload in switch. Split ports cannot be used as stack-link to stack an S4820T system.

The quad port must be in a default configuration before it can be split into 4x10G ports. The 40G port is lost in the config when the port is split, so be sure that the port is also removed from other L2/L3 feature configurations.

The system must be reloaded after issuing the CLI for the change to take effect.

This command cannot be used if LR4 optics are inserted on the 40G interface.

### Example (stack unit – Warning message when 13 ports are configured in any port range)

```
Dell(conf)#stack-unit 0 port 48 portmode quad
Maximum number of ports that can be made Quad mode in the
range <0-63> is configured. Ports 52,56,60, will be disabled
on reload.
Do you wish to continue? [confirm yes/no]:yes
Please save and reset unit 0 for the changes to take effect.
Dell(conf)#
```

## switchport

Place an interface in Layer 2 mode.

### S4820T

#### Syntax

```
switchport [backup interface {gigabit slot/port | tengigabit
slot/port | fortyGigE slot/port | port-channel number}]
```

To remove an interface from Layer 2 mode and place it in Layer 3 mode, enter the `no switchport` command. If a switchport backup interface is configured, first remove the backup configuration. To remove a switchport backup interface, enter the `no switchport backup interface {gigabit slot/port | tengigabit slot/port | fortyGigE slot/port | port-channel number}` command.

#### Parameters

##### backup interface

Use this option to configure a redundant Layer 2 link without using Spanning Tree. The keywords `backup interface` configures a backup port so that if the primary port fails, the

|                     |                                                                                                      |
|---------------------|------------------------------------------------------------------------------------------------------|
|                     | backup port changes to the up state. If the primary later comes up, it becomes the backup.           |
| <b>tengigabit</b>   | Enter the keyword <code>tengigabit</code> if the backup port is a 10G port.                          |
| <b>fortyGigE</b>    | Enter the keyword <code>fortyGigE</code> if the backup port is a 40G port.                           |
| <b>port-channel</b> | Enter the keywords <code>port-channel</code> if the backup port is a static or dynamic port channel. |
| <b>slot/port</b>    | Specify the line card and port number of the backup port.                                            |

**Defaults**

Disabled (The interface is in Layer 3 mode.)

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version             | Description                                                                              |
|---------------------|------------------------------------------------------------------------------------------|
| 9.7(0.0)            | Introduced on the S6000-ON.                                                              |
| 9.0.2.0             | Introduced on the S6000.                                                                 |
| 8.3.19.0            | Introduced on the S4820T.                                                                |
| 8.3.11.1            | Introduced on the Z9000.                                                                 |
| 8.5.1.0             | Added support for 4-port 40G line cards on ExaScale.                                     |
| 8.4.1.0             | Added support for port-channel interfaces (the <code>port-channel number</code> option). |
| 8.3.7.0             | Introduced on the S4810.                                                                 |
| 8.1.1.0             | Introduced on the E-Series ExaScale.                                                     |
| 7.7.1.0             | Added the <code>backup interface</code> option.                                          |
| 7.6.1.0             | Introduced on the S-Series.                                                              |
| 7.5.1.0             | Introduced on the C-Series.                                                              |
| pre-Version 6.2.1.0 | Introduced on the E-Series.                                                              |

**Usage Information**

If an IP address or VRRP group is assigned to the interface, you cannot use the `switchport` command on the interface. To use the `switchport` command on an interface, only the `no ip address` and `no shutdown` statements must be listed in the `show config` output.

When you enter the `switchport` command, the interface is automatically added to the default VLAN.

To use the `switchport backup interface` command on a port, first enter the `switchport` command. For more information, refer to the “Configuring Redundant Links” section in the “Layer 2” chapter of the *Dell Networking OS Configuration Guide*.

## Egress Interface Selection (EIS) Commands

The following commands are Egress Interface Selection (EIS) commands.

### application

Configure the management egress interface selection.

#### S4820T

##### Syntax

`application {all | application-type}`

To remove a management application configuration, use the `no application {all | application-type}` command.

##### Parameters

###### *application-type*

Enter any of the following keywords:

- For DNS, enter the keyword `dns`.
- For FTP, enter the keyword `ftp`.
- For NTP, enter the keyword `ntp`.
- For Radius, enter the keyword `radius`.
- For sFlow collectors, enter the keyword `sflow-collector`.
- For SNMP (traps and MIB responses), enter the keywords `snmp`.
- For SSH, enter the keyword `ssh`.
- For Syslog, enter the keyword `syslog`.
- For TACACS, enter the keyword `tacacs`.
- For Telnet, enter the keyword `telnet`.
- For TFTP, enter the keyword `tftp`.

###### `all`

Configure all applications.

##### Defaults

None.

##### Command Modes

EIS Mode (`conf-mgmt-eis`)

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                                 |
|-----------|---------------------------------------------|
| 9.2.(0.0) | Introduced on the Z9000, S4810, and S4820T. |

## application (for HTTP and ICMP)

Configure the management egress interface selection for HTTP and ICMP.

 **NOTE:** Only the options that have been newly introduced are described here. For a complete description on all of the keywords and variables that are available with this command, refer the respective Command Reference Guide of the applicable platform of the Release 9.2(0.0) documentation set.

### S4820T

#### Syntax

```
application {all | application-type}
```

To remove a management application configuration, use the `no application {all | application-type}` command.

#### Parameters

**application-type**

Enter any of the following keywords:

- For HTTP, enter the keyword `http`.
- For ICMP, enter the keyword `icmp`.

**all**

Configure all applications.

#### Defaults

None.

#### Command Modes

EIS Mode (`conf-mgmt-eis`)

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                                                                  |
|-----------|------------------------------------------------------------------------------|
| 9.3.(0.0) | Added support for the HTTP and ICMP traffic on the Z9000, S4810, and S4820T. |

## clear management application pkt-cntr

Clear management application packet counters for all management application types.

### S4820T

**Syntax** `clear management application pkt-cntr`

**Defaults** None.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                                 |
|-----------|---------------------------------------------|
| 9.2.(0.0) | Introduced on the Z9000, S4810, and S4820T. |

## clear management application pkt-fallback-cntr

Clear management application packet fallback counters for all management application types.

### S4820T

**Syntax** `clear management application pkt-fallback-cntr`

**Defaults** None.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                                 |
|-----------|---------------------------------------------|
| 9.2.(0.0) | Introduced on the Z9000, S4810, and S4820T. |

## management egress-interface-selection

To make configured application traffic egress through the management port instead of the front-end (FE) port, enable and configure a management egress interface.

### S4820T

**Syntax** `management egress-interface-selection`  
To disable and remove management egress interface selection (EIS) configurations, use the `no management egress-interface-selection` command.

**Defaults** None.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                 |
|----------|---------------------------------------------|
| 9.2(0.2) | Introduced on the Z9000, S4810, and S4820T. |

## show ip management-eis-route

Display the management routes used by EIS.

### S4820T

**Syntax** `show ip management-eis-route`

**Defaults** None.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                                 |
|-----------|---------------------------------------------|
| 9.2.(0.0) | Introduced on the Z9000, S4810, and S4820T. |

**Example**

```
Dell#show ip management-eis-route
Destination      Gateway          State           Route Source
-----
```

|               |                    |     |           |           |
|---------------|--------------------|-----|-----------|-----------|
| 10.11.0.0/16  | ManagementEthernet | 0/0 | Connected | Connected |
| 172.16.1.0/24 | 10.11.192.4        |     | Active    | Static    |

## show management application pkt-cntr

Display the number of packets for each application type that have taken the management route.

### S4820T

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | show management application pkt-cntr                                                                                                                           |
| <b>Defaults</b>        | None.                                                                                                                                                          |
| <b>Command Modes</b>   | EXEC Privilege                                                                                                                                                 |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version          | Description                                 |
|------------------|---------------------------------------------|
| <b>9.2.(0.0)</b> | Introduced on the Z9000, S4810, and S4820T. |

|                |                                           |
|----------------|-------------------------------------------|
| <b>Example</b> | Dell#show management application pkt-cntr |
|                | dns : 2                                   |
|                | ftp : 0                                   |
|                | ntp : 0                                   |
|                | radius : 0                                |
|                | sflow-collector : 0                       |
|                | snmp : 0                                  |
|                | ssh : 0                                   |
|                | syslog : 0                                |
|                | tacacs : 0                                |
|                | telnet : 0                                |
|                | tftp : 0                                  |

## show management application pkt-fallback-cntr

Display the number of packets for each application type that have been rerouted to the default routing table due to management port or route lookup failure.

### S4820T

|                      |                                               |
|----------------------|-----------------------------------------------|
| <b>Syntax</b>        | show management application pkt-fallback-cntr |
| <b>Defaults</b>      | None.                                         |
| <b>Command Modes</b> | EXEC Privilege                                |

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                                 |
|-----------|---------------------------------------------|
| 9.2.(0.0) | Introduced on the Z9000, S4810, and S4820T. |

## Example

```
Dell#show management application pkt-fallback-cntr
dns                : 0
ftp                : 0
ntp                : 0
radius             : 0
sflow-collector    : 0
snmp                : 0
ssh                : 2
syslog             : 0
tacacs             : 0
telnet             : 0
tftp               : 0
```

## Port Channel Commands

A Link Aggregation Group (LAG) is a group of links that appear to a MAC client as if they were a single link according to IEEE 802.3ad. In Dell Networking OS, a LAG is referred to as a Port Channel.

- For the S-Series and Z9000, the maximum port channel ID is 128 and the maximum members per port channel is 16.

Because each port can be assigned to only one Port Channel, and each Port Channel must have at least one port, some of those nominally available Port Channels might have no function because they could have no members if there are not enough ports installed. In the S-Series, stack members can provide those ports.

 **NOTE:** The Dell Networking OS implementation of LAG or Port Channel requires that you configure a LAG on both switches manually. For information about Dell Networking OS link aggregation control protocol (LACP) for dynamic LAGs, refer to the [Link Aggregation Control Protocol \(LACP\)](#) chapter. For more information about configuring and using Port Channels, refer to the *Dell Networking OS Configuration Guide*.

### channel-member

Add an interface to the Port Channel, while in INTERFACE PORTCHANNEL mode.

#### S4820T

**Syntax**                    channel-member *interface*

To delete an interface from a Port Channel, use the `no channel-member interface` command.

#### Parameters

- interface*** (OPTIONAL) Enter any of the following keywords and slot/port or number information:
- For a 100/1000 Ethernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

#### Defaults

Not configured.

#### Command Modes

INTERFACE PORTCHANNEL

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version             | Description                                          |
|---------------------|------------------------------------------------------|
| 9.7(0.0)            | Introduced on the S6000-ON.                          |
| 9.0.2.0             | Introduced on the S6000.                             |
| 8.3.19.0            | Introduced on the S4820T.                            |
| 8.3.11.1            | Introduced on the Z9000.                             |
| 8.5.1.0             | Added support for 4-port 40G line cards on ExaScale. |
| 8.3.7.0             | Introduced on the S4810.                             |
| 8.1.1.0             | Introduced on the E-Series ExaScale.                 |
| 7.6.1.0             | Introduced on the S-Series.                          |
| 7.5.1.0             | Introduced on the C-Series.                          |
| pre-Version 6.2.1.0 | Introduced on the E-Series.                          |

#### Usage Information

Use the `interface port-channel` command to access this command.

You cannot add an interface to a Port Channel if the interface contains an IP address in its configuration. Only the `shutdown`, `description`, `mtu`, and `ip mtu` commands can be configured on an interface if it is added to a Port Channel. The `mtu` and `ip mtu` commands are only available when the chassis is in Jumbo mode.

Link MTU and IP MTU considerations for Port Channels are:

- All members must have the same link MTU value and the same IP MTU value.
- The Port Channel link MTU and IP MTU must be less than or equal to the link MTU and IP MTU values configured on the channel members. For example, if the members have a link MTU of 2100 and an IP MTU 2000, the Port Channel's MTU values cannot be higher than 2100 for link MTU or 2000 bytes for IP MTU.

When an interface is removed from a Port Channel with the `no channel-member` command, the interface reverts to its configuration prior to joining the Port Channel.

An interface can belong to only one Port Channel.

You can have 16 interfaces per Port Channel on the S-Series and Z-Series. The interfaces can be located on different line cards but must be the same physical type and speed (for example, all 1-Gigabit Ethernet interfaces). However, you can combine 100/1000 interfaces and GE interfaces in the same Port Channel.

If the Port Channel contains a mix of interfaces with 100 Mb/s speed and 1000 Mb/s speed, the software disables those interfaces whose speed does not match the speed of the first interface configured and enabled in the Port Channel. If that first interface goes down, the Port Channel does not change its designated speed; disable and re-enable the Port Channel or change the order of the channel members configuration to change the designated speed. If the Port Channel contains a mix of interfaces with 100 Mb/s speed and 1000 Mb/s speed, the software disables those interfaces whose speed does not match the speed of the first interface configured and enabled in the Port Channel. If that first interface goes down, the Port Channel does not change its designated speed; disable and re-enable the Port Channel or change the order of the channel members configuration to change the designated speed. For more information about Port Channels, refer to the *Dell Networking OS Configuration Guide*.

#### Related Commands

[description](#) — assigns a descriptive text string to the interface.

[interface port-channel](#) — creates a Port Channel interface.

[shutdown](#) — disables/enables the port channel.

## group

Group two LAGs in a supergroup ("fate-sharing group" or "failover group").

### S4820T

#### Syntax

```
group group_number port-channel number port-channel number
```

To remove an existing LAG supergroup, use the `no group group_number` command.

#### Parameters

***group\_number*** Enter an integer from 1 to 32 that uniquely identifies this LAG fate-sharing group.

**port-channel number** Enter the keywords `port-channel` then an existing LAG number. Enter this keyword/variable combination twice, identifying the two paired LAGs.

**Defaults** none

**Command Modes** PORT-CHANNEL FAILOVER-GROUP (conf-po-failover-grp)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                         |
|----------|-----------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                         |
| 9.0.2.0  | Introduced on the S6000.                            |
| 8.3.19.0 | Introduced on the S4820T.                           |
| 8.3.11.1 | Introduced on the Z9000.                            |
| 8.3.7.0  | Introduced on the S4810.                            |
| 8.1.1.0  | Introduced on the E-Series ExaScale.                |
| 7.6.1.0  | Introduced on the C-Series, E-Series, and S-Series. |

**Related Commands** [port-channel failover-group](#) — accesses PORT-CHANNEL FAILOVER-GROUP mode to configure a LAG failover group.

[show interfaces port-channel](#) — displays information on configured Port Channel groups.

## interface port-channel

Create a Port Channel interface, which is a link aggregation group (LAG) containing 16 physical interfaces on the S-Series.

### S4820T

**Syntax** `interface port-channel channel-number`  
To delete a Port Channel, use the `no interface port-channel channel-number` command.

**Parameters** **channel-number** For a Port Channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.

**Defaults** Not configured.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version             | Description                      |
|---------------------|----------------------------------|
| 9.7(0.0)            | Introduced on the S6000-ON.      |
| Version 9.0.2.0     | Introduced on the S6000.         |
| Version 8.3.19.0    | Introduced on the S4820T.        |
| Version 8.3.12.0    | Introduced on S4810.             |
| Version 8.3.11.1    | Introduced on Z9000.             |
| Version 8.1.1.0     | Introduced on E-Series ExaScale. |
| Version 7.6.1.0     | Introduced on S-Series.          |
| Version 7.5.1.0     | Introduced on C-Series.          |
| pre-Version 6.2.1.0 | Introduced on E-Series.          |

**Usage Information**

Port Channel interfaces are logical interfaces and can be either in Layer 2 mode (by using the `switchport` command) or Layer 3 mode (by configuring an IP address). You can add a Port Channel in Layer 2 mode to a VLAN.

The `shutdown`, `description`, and `name` commands are the only commands that you can configure on an interface while it is a member of a Port Channel. To add a physical interface to a Port Channel, the interface can only have the `shutdown`, `description`, and `name` commands configured. The Port Channel's configuration is applied to the interfaces within the Port Channel.

A Port Channel can contain both 100/1000 interfaces and GE interfaces. Based on the first interface configured in the Port Channel and enabled, Dell Networking OS determines if the Port Channel uses 100 Mb/s or 1000 Mb/s as the common speed. For more information, refer to [channel-member](#).

If the line card is in a Jumbo mode chassis, you can also configure the `mtu` and `ip mtu` commands. The Link MTU and IP MTU values configured on the channel members must be greater than the Link MTU and IP MTU values configured on the Port Channel interface.

**NOTE:** In a Jumbo-enabled system, all members of a Port Channel must be configured with the same link MTU values and the same IP MTU values.

**Example**

```
Dell(conf)#int port-channel 2
Dell(conf-if-po-2)#
```

## Related Commands

[channel-member](#) — adds a physical interface to the LAG.

[interface](#) — configures a physical interface.

[interface loopback](#) — configures a Loopback interface.

[interface null](#) — configures a null interface.

[interface vlan](#) — configures a VLAN.

[shutdown](#) — disables/enables the port channel.

## minimum-links

Configure the minimum number of links in a LAG (Port Channel) that must be in “oper up” status for the LAG to be also in “oper up” status.

### S4820T

#### Syntax

```
minimum-links number
```

#### Parameters

***number*** Enter the number of links in a LAG that must be in “oper up” status. The range is from 1 to 16. The default is **1**.

#### Defaults

**1**

#### Command Modes

INTERFACE

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version                | Description                          |
|------------------------|--------------------------------------|
| 9.7(0.0)               | Introduced on the S6000-ON.          |
| 9.0.2.0                | Introduced on the S6000.             |
| 8.3.19.0               | Introduced on the S4820T.            |
| 8.3.11.1               | Introduced on the Z9000.             |
| 8.3.7.0                | Introduced on the S4810.             |
| 8.1.1.0                | Introduced on the E-Series ExaScale. |
| 7.6.1.0                | Introduced on the S-Series.          |
| 7.5.1.0                | Introduced on the C-Series.          |
| pre-Version<br>6.2.1.0 | Introduced on the E-Series.          |

**Usage Information**

If you use this command to configure the minimum number of links in a LAG that must be in “oper up” status, the LAG must have at least that number of “oper up” links before it can be declared as up. For example, if the required minimum is four, and only three are up, the LAG is considered down.

## port-channel failover-group

To configure a LAG failover group, access PORT-CHANNEL FAILOVER-GROUP mode.

### S4820T

**Syntax**

`port-channel failover-group`

To remove all LAG failover groups, use the `no port-channel failover-group` command.

**Defaults**

none

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                          |
|----------|--------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.          |
| 9.0.2.0  | Introduced on the S6000.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.3.7.0  | Introduced on the S4810.             |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 7.6.1.0  | Introduced on the S-Series.          |

**Usage Information**

This feature groups two LAGs to work in tandem as a supergroup. For example, if one LAG goes down, the other LAG is taken down automatically, providing an alternate path to reroute traffic, avoiding oversubscription on the other LAG. You can use both static and dynamic (LACP) LAGs to configure failover groups. For more information, refer to the “Port Channel” chapter in the *Dell Networking OS Configuration Guide*.

**Related Command**

[group](#) — groups two LAGs in a supergroup (“fate-sharing group”).

[show interfaces port-channel](#) — displays information on configured Port Channel groups.

## show config

Display the current configuration of the selected LAG.

### S4820T

**Syntax** `show config`

**Command Modes** INTERFACE PORTCHANNEL

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version             | Description                 |
|---------------------|-----------------------------|
| 8.3.19.0            | Introduced on the S4820T.   |
| 8.3.11.1            | Introduced on the Z9000.    |
| 8.3.7.0             | Introduced on the S4810.    |
| 7.6.1.0             | Introduced on the S-Series. |
| 7.5.1.0             | Introduced on the C-Series. |
| pre-Version 6.2.1.0 | Introduced on the E-Series. |

**Example**

```
Dell(conf-if-po-1)#show config
!
interface Port-channel 1
  no ip address
  shutdown
Dell(conf-if-po-1)#
```

## show interfaces port-channel

Display information on configured Port Channel groups.

### S4820T

**Syntax** `show interfaces port-channel [channel-number] [brief]`

**Parameters**

|                       |                                                                                                                                                     |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>channel-number</b> | For a Port Channel interface, enter the keyword <code>port-channel</code> then a number. For the C-Series and S-Series, the range is from 1 to 128. |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|

**brief** (OPTIONAL) Enter the keyword `brief` to display only the port channel number, the state of the port channel, and the number of interfaces in the port channel.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                    |
|----------|--------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                    |
| 9.0.2.0  | Introduced on the S6000.                                                       |
| 8.3.19.0 | Introduced on the S4820T.                                                      |
| 8.3.11.1 | Introduced on the Z9000.                                                       |
| 8.3.7.0  | Introduced on the S4810.                                                       |
| 8.1.1.0  | Introduced on the E-Series ExaScale.                                           |
| 7.6.1.0  | Introduced on the S-Series. Modified to display the LAG failover group status. |
| 7.5.1.0  | Introduced on the C-Series.                                                    |

**E-Series legacy command**

**Usage Information**

The following describes the `show interfaces port-channel` command shown in the following example.

| Field                          | Description                                                                                                                    |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <b>Port-Channel 1...</b>       | Displays the LAG's status. In the Example, the status of the LAG's LAG fate-sharing group ("Failover-group") is listed.        |
| <b>Hardware is...</b>          | Displays the interface's hardware information and its assigned MAC address.                                                    |
| <b>Port-channel is part...</b> | Indicates whether the LAG is part of a LAG fate-sharing group ("Failover-group").                                              |
| <b>Internet address...</b>     | States whether an IP address is assigned to the interface. If an IP address is assigned, that address is displayed.            |
| <b>MTU 1554...</b>             | Displays link and IP MTU.                                                                                                      |
| <b>LineSpeed</b>               | Displays the interface's line speed. For a port channel interface, it is the line speed of the interfaces in the port channel. |

| Field                 | Description                                                                                                                                                                                                       |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Members in this...    | Displays the interfaces belonging to this port channel.                                                                                                                                                           |
| ARP type:...          | Displays the ARP type and the ARP timeout value for the interface.                                                                                                                                                |
| Last clearing...      | Displays the time when the <code>show interfaces counters</code> were cleared.                                                                                                                                    |
| Queueing strategy.    | States the packet queuing strategy. FIFO means first in first out.                                                                                                                                                |
| packets input...      | Displays the number of packets and bytes into the interface.                                                                                                                                                      |
| Input 0 IP packets... | Displays the number of packets with IP headers, VLAN tagged headers, and MPLS headers. The number of packets may not add correctly because a VLAN tagged IP packet counts as both a VLAN packet and an IP packet. |
| 0 64-byte...          | Displays the size of packets and the number of those packets entering that interface. This information is displayed over two lines.                                                                               |
| Received 0...         | Displays the type and number of errors or other specific packets received. This information is displayed over three lines.                                                                                        |
| Output 0...           | Displays the type and number of packets sent out the interface. This information is displayed over three lines.                                                                                                   |
| Rate information...   | Displays the traffic rate information into and out of the interface. Traffic rate is displayed in bits and packets per second.                                                                                    |
| Time since...         | Displays the time since the last change in the configuration of this interface.                                                                                                                                   |

### Example

```

Dell#show interfaces port-channel 20
Port-channel 20 is up, line protocol is up (Failover-group 1
is down)
Hardware address is 00:01:e8:01:46:fa
Port-channel is part of failover-group 1
Internet address is 1.1.120.1/24
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed 2000 Mbit
Members in this channel: Gi 2/5 Gi 2/18
ARP type: ARPA, ARP timeout 04:00:00
Last clearing of "show interfaces" counters 00:00:00
Queueing strategy: fifo
  44507301 packets input, 3563070343 bytes
  Input 44506754 IP Packets, 0 Vlans 0 MPLS
  41 64-byte pkts, 44502871 over 64-byte pkts, 249 over 127-
byte pkts
  407 over 255-byte pkts, 3127 over 511-byte pkts, 606 over
1023-byte pkts
  Received 0 input symbol errors, 0 runts, 0 giants, 0
throttles
  0 CRC, 0 IP Checksum, 0 overrun, 0 discarded
  1218120 packets output, 100745130 bytes, 0 underruns

```

```

Output 5428 Multicasts, 4 Broadcasts, 1212688 Unicasts
1216142 IP Packets, 0 Vlans, 0 MPLS
0 throttles, 0 discarded
Rate info (interval 299 sec):
Input 01.50Mbits/sec, 2433 packets/sec
Output 00.02Mbits/sec,4 packets/sec
Time since last interface status change: 00:22:34

```

Dell#

## User Information

The following describes the `show interfaces port-channel brief` command shown in the following example.

| Field      | Description                                                                                                                                                                                                                                                                                                                                 |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LAG        | Lists the port channel number.                                                                                                                                                                                                                                                                                                              |
| Mode       | Lists the mode: <ul style="list-style-type: none"> <li>L3 — for Layer 3</li> <li>L2 — for Layer 2</li> </ul>                                                                                                                                                                                                                                |
| Status     | Displays the status of the port channel. <ul style="list-style-type: none"> <li>down — if the port channel is disabled (<code>shutdown</code>)</li> <li>up — if the port channel is enabled (<code>no shutdown</code>)</li> </ul>                                                                                                           |
| Uptime     | Displays the age of the port channel in hours:minutes:seconds.                                                                                                                                                                                                                                                                              |
| Ports      | Lists the interfaces assigned to this port channel.                                                                                                                                                                                                                                                                                         |
| (untitled) | Displays the status of the physical interfaces (up or down). <ul style="list-style-type: none"> <li>In Layer 2 port channels, an * (asterisk) indicates which interface is the primary port of the port channel. The primary port sends out interface PDU.</li> <li>In Layer 3 port channels, the primary port is not indicated.</li> </ul> |

## Example

```

Dell#show interfaces port-channel 1 brief

LAG Mode Status Uptime   Ports
1   L2  up    00:00:08  Te 3/1 (Up) *
                   Te 3/2 (Down)
                   Te 3/3 (Up)

Dell#

```

## Related Commands

[show lacp](#) — displays the LACP matrix.

## show port-channel-flow

Display an egress port in a given port-channel flow.

### S4820T

#### Syntax

```
show port-channel-flow outgoing-port-channel number incoming-  
interface interface {source-ip address destination-ip address}  
| {source-port number destination-port number} | {source-mac  
address destination-mac address {vlan vlanid | ether-type}}
```

#### Parameters

**outgoing-port-channel  
*number***

Enter the keywords `outgoing-port-channel` then the number of the port channel to display flow information.

- For a Port Channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.

**incoming-interface  
*interface***

Enter the keywords `incoming-interface` then the interface type and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**source-ip  
*address***

Enter the keywords `source-ip` then the IP source address in IP address format.

**destination-ip  
*address***

Enter the keywords `destination-ip` then the IP destination address in IP address format.

**source-port  
*number***

Enter the keywords `source-port` then the source port number. The range is from 1 to 65536. The default is **None**.

**destination-port  
*number***

Enter the keywords `destination-port` then the destination port number. The range is from 1 to 65536. The default is **None**.

**source-mac  
*address***

Enter the keywords `source-mac` then the MAC source address in the `nn:nn:nn:nn:nn:nn` format.

**destination-mac  
*address***

Enter the keywords `destination-mac` then the MAC destination address in the `nn:nn:nn:nn:nn:nn` format.

**vlan *vlan-id***

Enter the keywords `vlan` then the VLAN-id. The range is from 0 to 4094.

**ether-type**

Enter the keywords `ether-type` in the `XX:XX` format.

#### Command Modes

EXEC

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 9.0.2.0  | Introduced on the S6000.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.11.1 | Introduced on the Z9000.  |
| 8.3.10.0 | Introduced on the S4810.  |

## Usage Information

Because this command calculates based on a Layer 2 hash algorithm, use this command to display flows for switched Layer 2 packets, not for routed packets (use the `show ip flow` command to display routed packets).

The `show port-channel-flow` command returns the egress port identification in a given port-channel if a valid flow is entered. A mismatched flow error occurs if MAC-based hashing is configured for a Layer 2 interface and you are trying to display a Layer 3 flow.

The output displays three entries:

- Egress port for unfragmented packets.
- In the event of fragmented packets, the egress port of the first fragment.
- In the event of fragmented packets, the egress port of the subsequent fragments.

**NOTE:** In the `show port channel flow` command output, the egress port for an unknown unicast, multicast, or broadcast traffic is not displayed.

The following example shows the `show port-channel-flow outgoing-port-channel number incoming-interface interface source-mac address destination-mac address`

- Load-balance is configured for MAC
- Load-balance is configured for IP 4-tuple/2-tuple
- A non-IP payload is going out of Layer 2 LAG interface that is a member of VLAN with an IP address

## Example

```
Dell#show port-channel-flow outgoing-port-channel 1 incoming-  
interface te 3/3  
source-mac 00:00:50:00:00:00 destination-mac 00:00:a0:00:00:00
```

```
Egress Port for port-channel 1, for the given flow, is Te  
13/2
```

# Time Domain Reflectometer (TDR)

TDR is useful for troubleshooting an interface that is not establishing a link; either it is flapping or not coming up at all. TDR detects open or short conditions of copper cables on 100/1000 Base-T modules.

## Important Points to Remember

- The interface and port must be enabled (configured—refer to the `interface` command) before running TDR. An error message is generated if you have not enabled the interface.
- The interface on the far-end device must be shut down before running TDR.
- Because TDR is an intrusive test on an interface that is not establishing a link, do not run TDR on an interface that is passing traffic.
- When testing between two devices, do not run the test on both ends of the cable.

## tdr-cable-test

Test the condition of copper cables on 100/1000 Base-T modules.

### S4820T

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>tdr-cable-test interface</code>                                                                                                                          |
| <b>Parameters</b>      | <b><i>interface</i></b> Enter the keyword <code>TenGigabitEthernet</code> then the slot/port information for the 100/1000 Ethernet interface.                  |
| <b>Defaults</b>        | none                                                                                                                                                           |
| <b>Command Modes</b>   | EXEC                                                                                                                                                           |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                          |
|----------|--------------------------------------|
| 9.7.0.0  | Introduced on the S5000.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.3.7.0  | Introduced on the S4810.             |
| 8.2.1.0  | Introduced on the E-Series ExaScale. |
| 7.7.1.0  | Introduced on the S Series.          |
| 7.6.1.0  | Introduced on the C-Series.          |
| 6.1.1.0  | Introduced on the E-Series.          |

**Usage Information**

The interface must be enabled to run the test or an error message is generated:

```
Dell#tdr-cable-test tengigabitethernet 11/1
% Error: Interface is disabled Te 11/1.
```

Syslog messages are generated when the link flaps during TDR tests.

**Related Commands**

[show tdr](#) — displays the results of the TDR test.

## show tdr

Display the TDR test results.

### S4820T

**Syntax**

```
show tdr interface
```

**Parameters**

**interface** Enter the keyword `TenGigabitEthernet` then the slot/port information for the 100/1000 Ethernet interface.

**Defaults**

none

**Command Modes**

EXEC

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                          |
|----------|--------------------------------------|
| 9.7.0.0  | Introduced on the S5000.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.3.7.0  | Introduced on the S4810.             |
| 8.2.1.0  | Introduced on the E-Series ExaScale. |
| 7.7.1.0  | Introduced on the S-Series.          |
| 7.6.1.0  | Introduced on the C-Series.          |
| 6.1.1.0  | Introduced.                          |

**Usage Information**

If the TDR test has not been run, an error message is generated:

```
%Error: Please run the TDR test first
```

The following describes the TDR test status.

| Status                                                | Definition                                                                                                                        |
|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <b>OK Status:<br/>Terminated</b>                      | TDR test is complete, no fault is detected on the cable, and the test is terminated.                                              |
| <b>Length: 92 (+/- 1) meters, Status:<br/>Shorted</b> | A short is detected on the cable. The location, in this Example is 92 meters. The short is accurate to plus or minus one meter.   |
| <b>Length: 93 (+/- 1) meters, Status:<br/>Open</b>    | An opening is detected on the cable. The location, in this Example is 93 meters. The open is accurate to plus or minus one meter. |
| <b>Status:<br/>Impedance<br/>Mismatch</b>             | There is an impedance mismatch in the cables.                                                                                     |

### Example

```
Dell#show tdr tengigabitethernet 11/2
Time since last test: 00:00:11
  Pair A, Length: OK Status: Terminated
  Pair B, Length: OK Status: Terminated
  Pair C, Length: OK Status: Terminated
  Pair D, Length: OK Status: Terminated
```

### Related Commands

[tdr-cable-test](#) — runs the TDR test.

## UDP Broadcast

The user datagram protocol (UDP) broadcast feature is a software-based method to forward low throughput (not to exceed 200 pps) IP/UDP broadcast traffic arriving on a physical or VLAN interface.

### Important Points to Remember

- This feature is available only on the S4820T platform.
- Routing information protocol (RIP) is not supported with the UDP Broadcast feature.
- If you configure this feature on an interface using the `ip udp-helper udp-port` command, the `ip directed-broadcast` command becomes ineffective on that interface.
- The existing `show interface` command has been modified to display the configured broadcast address.

## debug ip udp-helper

Enable UDP debug and display the debug information on a console.

### S4820T

**Syntax**                    `debug ip udp-helper`  
To disable debug information, use the `no debug ip udp-helper` command.

**Defaults**                 Debug disabled.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**         This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version                    | Description                          |
|----------------------------|--------------------------------------|
| <b>8.3.19.0</b>            | Introduced on the S4820T.            |
| <b>8.3.11.1</b>            | Introduced on the Z9000.             |
| <b>8.3.7.0</b>             | Introduced on the S4810.             |
| <b>Pre-version 8.3.7.0</b> | Introduced on the E-Series ExaScale. |

**Example**

```
Dell#debug ip udp-helper
UDP helper debugging is on

01:20:22: Pkt rcvd on Gi 5/0 with IP DA (0xffffffff) will be
sent on Gi 5/1 Gi 5/2
Vlan 3

01:44:54: Pkt rcvd on Gi 7/0 is handed over for DHCP
processing.
```

**Related Commands**

- [ip udp-broadcast-address](#) — configures a UDP IP address for broadcast.
- [ip udp-helper udp-port](#) — enables the UDP broadcast feature on an interface.
- [show ip udp-helper](#) — displays the configured UDP helper(s) on all interfaces.

## ip udp-broadcast-address

Configure an IP UDP address for broadcast.

**Syntax** `ip udp-broadcast-address address`  
To delete the configuration, use the `no ip udp-broadcast-address address` command.

**Parameters**

|                |                                                                   |
|----------------|-------------------------------------------------------------------|
| <b>address</b> | Enter an IP broadcast address in dotted decimal format (A.B.C.D). |
|----------------|-------------------------------------------------------------------|

**Defaults** Not configured.

**Command Modes** INTERFACE (config-if)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version             | Description                          |
|---------------------|--------------------------------------|
| 8.3.19.0            | Introduced on the S4820T.            |
| 8.3.7.0             | Introduced on the S4810.             |
| Pre-version 8.3.7.0 | Introduced on the E-Series ExaScale. |

**Usage Information** When a UDP broadcast packet is flooded out of an interface, and the outgoing interface is configured using this command, the outgoing packet's IP destination address is replaced with the configured broadcast address.

**Related Commands** [debug ip udp-helper](#) — enables debug and displays the debug information on a console.

[show ip udp-helper](#) — displays the configured UDP helpers on all interfaces.

## ip udp-helper udp-port

Enable the UDP broadcast feature on an interface either for all UDP ports or a specified list of UDP ports.

### S4820T

**Syntax** `ip udp-helper udp-port [udp-port-list]`  
To disable the UDP broadcast on a port, use the `no ip udp-helper udp-port [udp-port-list]` command.

## Parameters

***udp-port-list*** (OPTIONAL) Enter up to 16 comma-separated UDP port numbers.

**NOTE:** If you do not use this option, all UDP ports are considered by default.

## Defaults

none

## Command Modes

INTERFACE (config-if)

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version             | Description                          |
|---------------------|--------------------------------------|
| 8.3.19.0            | Introduced on the S4820T.            |
| 8.3.11.1            | Introduced on the Z9000.             |
| 8.3.7.0             | Introduced on the S4810.             |
| Pre-version 8.3.7.0 | Introduced on the E-Series ExaScale. |

## Usage Information

If you configure the `ip helper-address` command and `ip udp-helper udp-port` command, the behavior is that the UDP broadcast traffic with port numbers 67/68 is unicast relayed to the DHCP server per the `ip helper-address` configuration. This occurs regardless if the `ip udp-helper udp-port` command contains port numbers 67/68 or not.

If you only configure the `ip udp-helper udp-port` command, all the UDP broadcast traffic is flooded, including ports 67/68 traffic if those ports are part of the `udp-port-list`.

## Related Commands

[ip helper-address](#) — configures the destination broadcast or host address for the DHCP server.

[debug ip udp-helper](#) — enables debug and displays the debug information on a console.

[show ip udp-helper](#) — displays the configured UDP helpers on all interfaces.

## show ip udp-helper

Display the configured UDP helpers on all interfaces.

### S4820T

**Syntax** `show ip udp-helper`

**Defaults** none

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version             | Description                          |
|---------------------|--------------------------------------|
| 8.3.19.0            | Introduced on the S4820T.            |
| 8.3.11.1            | Introduced on the Z9000.             |
| 8.3.7.0             | Introduced on the S4810.             |
| Pre-version 8.3.7.0 | Introduced on the E-Series ExaScale. |

### Example

```
Dell#show ip udp-helper
-----
Port      UDP port list
-----
Te 10/2   656, 658
Te 10/3   All
```

### Related Commands

[debug ip udp-helper](#) — enables debug and displays the debug information on a console.

[ip udp-broadcast-address](#) — configures a UDP IP address for broadcast.

[ip udp-helper udp-port](#) — enables the UDP broadcast feature on an interface either for all UDP ports or a specified list of UDP ports.

## Enhanced Validation of Interface Ranges

This functionality is supported on the S4820T platform.

You can avoid specifying spaces between the range of interfaces, separated by commas, that you configure by using the `interface range` command. For example, if you enter a list of interface ranges,

such as `interface range fo 2/0-1,te 10/0,gi 3/0,fa 0/0`, this configuration is considered valid. The comma-separated list is not required to be separated by spaces in between the ranges. You can associate multicast MAC or hardware addresses to an interface range and VLANs by using the `mac-address-table static multicast-mac-address vlan vlan-id output-range interface` command.

## ip http source-interface

Specify an interface as the source interface for HTTP connections.

This feature is supported on S4820T platform.

**Syntax** `ip http source-interface interface`  
 To delete an interface, use the `no ip http source-interface interface` command.

**Parameters** `interface`

Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults** The IP address on the system that is closest to the Telnet address is used in the outgoing packets.

**Command Modes** CONFIGURATION

| Command History | Version  | Description                                              |
|-----------------|----------|----------------------------------------------------------|
|                 | 9.7(0.0) | Introduced on the S6000-ON.                              |
|                 | 9.3(0.1) | Introduced on the S4810, S4820T, S6000, and Z9000.       |
|                 | 8.3.11.1 | Introduced on the Z9000                                  |
|                 | 8.2.1.0  | Increased number of VLANs on ExaScale to 4094 (was 2094) |
|                 | 8.1.1.0  | Introduced on E-Series ExaScale                          |
|                 | 7.6.1.0  | Support added for S-Series                               |

| Version | Description            |
|---------|------------------------|
| 7.5.1.0 | Introduced on C-Series |

Configuring source interface for ftp communications.

# Internet Protocol Security (IPSec)

Internet protocol security (IPSec) is an end-to-end security scheme for securing IP communications by authenticating and encrypting all packets in a session. Use IPSec between hosts, gateways, or hosts and gateways.

IPSec uses a series of protocol functions to achieve information security:

- **Authentication Headers (AH)** — Connectionless integrity and origin authentication for IP packets.
- **Encapsulating Security Payloads (ESP)** — Confidentiality, authentication, and data integrity for IP packets.
- **Security Associations (SA)** — Algorithm-provided parameters required for AH and ESP protocols.

IPSec capability is available on control (protocol) and management traffic; end-node support is required.

IPSec supports two operational modes: Transport and Tunnel.

- Transport is the default mode for IPSec and encrypts only the payload of the packet. Routing information is unchanged.
- Tunnel mode is used to encrypt the entire packet, including the routing information in the IP header. Tunnel mode is typically used in creating virtual private networks (VPNs).

Transport mode provides IP packet payload protection using ESP. You can use ESP alone or in combination with AH to provide additional authentication. AH protects data from modification but does not provide confidentiality.

SA is the configuration information that specifies the type of security provided to the IPSec flow. The SA is a set of algorithms and keys used to authenticate and encrypt the traffic flow. The AH and ESP use SA to provide traffic protection for the IPSec flow.

## NOTE:

Due to performance limitations on the control processor, you cannot enable IPSec on all packets in a communication session.

## crypto ipsec transform-set

Create a transform set, or combination of security algorithms and protocols, of cryptos.

### S4820T

```
Syntax      crypto ipsec transform-set name {ah-authentication {md5|sha1|
            null} | esp-authentication {md5|sha1|null} | esp-encryption
            {3des|cbc|des|null}}
```

To delete a transform set, use the `no crypto ipsec transform-set name {ah-authentication {md5|sha1|null} | esp-authentication {md5|sha1|null} | esp-encryption {3des|cbc|des|null}}` command.

## Parameters

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>name</i></b>        | Enter the name for the transform set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>ah-authentication</b>  | <p>Enter the keywords <code>ah-authentication</code> then the transform type of operation to apply to traffic. The transform type represents the encryption or authentication applied to traffic.</p> <ul style="list-style-type: none"> <li>• <code>md5</code> — Use Message Digest 5 (MD5) authentication.</li> <li>• <code>sha1</code> — Use Secure Hash Algorithm 1 (SHA-1) authentication.</li> <li>• <code>null</code> — Causes an encryption policy configured for the area to not be inherited on the interface.</li> </ul>  |
| <b>esp-authentication</b> | <p>Enter the keywords <code>esp-authentication</code> then the transform type of operation to apply to traffic. The transform type represents the encryption or authentication applied to traffic.</p> <ul style="list-style-type: none"> <li>• <code>md5</code> — Use Message Digest 5 (MD5) authentication.</li> <li>• <code>sha1</code> — Use Secure Hash Algorithm 1 (SHA-1) authentication.</li> <li>• <code>null</code> — Causes an encryption policy configured for the area to not be inherited on the interface.</li> </ul> |
| <b>esp-encryption</b>     | <p>Enter the keywords <code>esp-encryption</code> then the transform type of operation to apply to traffic. The transform type represents the encryption or authentication applied to traffic.</p> <ul style="list-style-type: none"> <li>• <code>3des</code> — Use 3DES encryption.</li> <li>• <code>cbc</code> — Use CDC encryption.</li> <li>• <code>des</code> — Use DES encryption.</li> <li>• <code>null</code> — Causes an encryption policy configured for the area to not be inherited on the interface.</li> </ul>         |

## Command Modes

CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                 |
|----------|---------------------------------------------|
| 9.2(0.2) | Introduced on the Z9000, S4810, and S4820T. |

#### Usage Information

- Both sides of the link must specify the same transform set.
- You can create up to 64 transform sets.

#### Example

```
Dell(conf)#do show crypto ipsec transform-set

Transform-Set Name      : ts1
Transform-Set refCnt    : 0
AH Transform            : md5
ESP Auth Transform      :
ESP Encry Transform     :

Dell(conf)#
```

## crypto ipsec policy

Create a crypto policy used by ipsec.

### S4820T

#### Syntax

```
crypto ipsec policy name seq-num ipsec-manual
```

To delete a crypto policy entry, use the `no crypto ipsec policy name seq-num ipsec-manual` command.

#### Parameters

|                       |                                                                |
|-----------------------|----------------------------------------------------------------|
| <b><i>name</i></b>    | Enter the name for the crypto policy set.                      |
| <b><i>seq-num</i></b> | Enter the sequence number assigned to the crypto policy entry. |

#### Defaults

none

| 9.2(0.2)               | Introduced on the Z9000, S4810, and S4820T.                                                                                                                                                                                                                                                                                                                                                                                                           |         |             |          |                                             |

## match

Apply an match filter to the crypto policy.

### S4820T

|               |                                                                                                                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <pre>match seq-num tcp [source ip address   ipv6 address {mask} {source-port number}] [destination ip address   ipv6 address {mask} {destination-port number}]</pre> <p>To remove the match filter for the crypto map, use the <code>no match seq-num tcp [source ip address   ipv6 address {mask} {source-port number}]</code></p> |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

[*destination ip address | ipv6 address {mask} {destination-port number}*] command.

## Parameters

|                                               |                                                                                     |
|-----------------------------------------------|-------------------------------------------------------------------------------------|
| <b><i>seq-num</i></b>                         | Enter the match command sequence number.                                            |
| <b><i>sourceip-address   ipv6 address</i></b> | Enter the keyword <code>source</code> then the IPv4 or IPv6 address for the source. |
| <b><i>mask</i></b>                            | Enter the mask prefix length in /nn format.                                         |
| <b><i>source-port number</i></b>              | Enter the source port number.                                                       |
| <b><i>destination-port number</i></b>         | Enter the destination port number.                                                  |

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                 |
|----------|---------------------------------------------|
| 9.2(0.2) | Introduced on the Z9000, S4810, and S4820T. |

## Usage Information

- IPv4 addresses support only -/32 mask types.
- IPv6 addresses support only -/128 mask types.
- Configure match for bi-directional traffic for optimal routing.
- Only TCP is supported.

## Example

```
match 0 tcp a::1 /128 0 a::2 /128 23
match 1 tcp a::1 /128 23 a::2 /128 0
match 2 tcp a::1 /128 0 a::2 /128 21
match 3 tcp a::1 /128 21 a::2 /128 0
match 4 tcp 1.1.1.1 /32 0 1.1.1.2 /32 23
match 5 tcp 1.1.1.1 /32 23 1.1.1.2 /32 0
match 6 tcp 1.1.1.1 /32 0 1.1.1.2 /32 21
match 7 tcp 1.1.1.1 /32 21 1.1.1.2 /32 0
```

# session-key

Specify the session keys used in the crypto policy entry.

## S4820T

### Syntax

```
session-key {inbound | outbound} {ah spi hex-key-string | esp  
spi encrypt hex-key-string auth hex-key-string
```

To delete the session key information from the crypto policy, use the `no session-key {inbound | outbound} {ah | esp}` command.

### Parameters

|                       |                                                                                                                                                                                     |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>name</b>           | Enter the name for the transform set.                                                                                                                                               |
| <b>inbound</b>        | Specify the inbound session key for IPSec.                                                                                                                                          |
| <b>outbound</b>       | Specify the outbound session key for IPSec.                                                                                                                                         |
| <b>ah</b>             | Use the AH protocol when you select the AH transform set in the crypto policy.                                                                                                      |
| <b>esp</b>            | Use the ESP protocol when you select the ESP transform set in the crypto policy.                                                                                                    |
| <b>spi</b>            | Enter the security parameter index number.                                                                                                                                          |
| <b>hex-key-string</b> | Enter the session key in hex format (a string of 8, 16, or 20 bytes). For DES algorithms, specify at least 16 bytes per key. For SHA algorithms, specify at least 20 bytes per key. |
| <b>encrypt</b>        | Indicates the ESP encryption transform set key string.                                                                                                                              |
| <b>auth</b>           | Indicates the ESP authentication transform set key string.                                                                                                                          |

### Defaults

none

### Command Modes

CONF-CRYPTO-POLICY

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                 |
|----------|---------------------------------------------|
| 9.2(0.2) | Introduced on the Z9000, S4810, and S4820T. |

### Usage Information

- This command is only available in the ipsec-manual model.
- The key information entry is associated with the global method for enabling clear text or encrypted display in the running config.

# show crypto ipsec transform-set

Display the transform set configuration.

## S4820T

**Syntax** `show crypto ipsec transform-set name`

**Parameters** *name* Enter the name of the transform set.

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                 |
|----------|---------------------------------------------|
| 9.2(0.2) | Introduced on the Z9000, S4810, and S4820T. |

**Example**

```
Dell#show crypto ipsec transform-set

Transform-Set Name      : dallas
Transform-Set refCnt   : 0
AH Transform           :
ESP Auth Transform     :
ESP Encry Transform    : 3des
Dell#
```

# show crypto ipsec policy

Display the crypto policy configuration.

## S4820T

**Syntax** `show crypto ipsec policy`

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

**Version 9.2(0.2)** Introduced on the Z9000, S4810, and S4820T.

**Example**

```
Dell(conf-crypto-policy)#do show crypto ipsec policy

Policy name           : poll
Policy refcount       : 0
Sequence Num         : 1
SA Mode               : IPSEC-MANUAL
Transform-Set Name    :
Peer IP Address       :
Inbound AH SPI        : 0
Inbound ESP Auth SPI : 0
Inbound ESP Encry SPI : 0
Inbound AH Key        : [0]::
Inbound ESP Auth Key  : [0]::
Inbound ESP Encry Key : [0]::
Outbound AH SPI       : 0
Outbound ESP Auth SPI : 0
Outbound ESP Encry SPI : 0
Outbound AH Key       : [0]::
Outbound ESP Auth Key : [0]::
Outbound ESP Encry Key : [0]::

Match sequence Num    : 2
Protocol type         : tcp
IP or IPv6            : IP
Source address        : 1.1.1.1
Source mask           : /32
Source port           : 0
Destination address   : 1.1.1.2
Destination mask      : /32
Destination port      : 23
source-interface name :
source-interface num  :

Dell(conf-crypto-policy)#
```

## transform-set

Specify the transform set the crypto policy uses.

### S4820T

**Syntax**

```
transform-set transform-set-name
```

To delete a transform set from the crypto policy, use the `no transform-set transform-set-name` command.

**Parameters**

***transform-set-name***

Enter the name for the crypto policy transform set.

**Defaults**

none

**Command Modes**

CONFIG-CRYPTO-POLICY

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| <b>Version</b>  | <b>Description</b>                          |
|-----------------|---------------------------------------------|
| <b>9.2(0.2)</b> | Introduced on the Z9000, S4810, and S4820T. |

# IPv4 Routing

The basic IPv4 commands are supported by Dell Networking operating system on the S4820T platform.

## arp

To associate an IP address with a MAC address in the switch, use address resolution protocol (ARP).

|                      |                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------|---------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>        | <code>arp [vrf vrf-name] ip-address mac-address interface</code>          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                      | To remove an ARP address, use the <code>no arp ip-address</code> command. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Parameters</b>    | <b><i>vrf vrf-name</i></b>                                                | Enter a VRF name to configure an ARP entry for that VRF. Use the VRF option after the keyword <code>arp</code> to configure a static arp on that particular VRF.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|                      | <b><i>ip-address</i></b>                                                  | Enter an IP address in dotted decimal format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|                      | <b><i>mac-address</i></b>                                                 | Enter a MAC address in nnnn.nnnn.nnnn format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|                      | <b><i>interface</i></b>                                                   | (OPTIONAL) Enter any of the following keywords and slot/port or number information: <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>• For the Management interface on the stack-unit, enter the keyword <code>ManagementEthernet</code> then the slot/port information. The slot range is from 0 to 1. The port range is 0.</li> <li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li> </ul> |
| <b>Defaults</b>      | Not configured.                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Command Modes</b> | CONFIGURATION                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                                          |
|-------------|------------------------------------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON.                          |
| 9.4(0.0)    | Added support for VRF.                               |
| 9.0.2.0     | Introduced on the S6000.                             |
| 8.3.19.0    | Introduced on the S4820T.                            |
| 8.3.11.1    | Introduced on the Z9000.                             |
| 8.5.1.0     | Added support for 4-port 40G line cards on ExaScale. |
| 8.3.7.0     | Introduced on the S4810.                             |
| 8.1.1.0     | Introduced on the E-Series ExaScale.                 |
| 7.6.1.0     | Introduced on the S-Series.                          |
| 7.5.1.0     | Introduced on the C-Series.                          |
| pre-6.2.1.0 | Introduced on the E-Series.                          |

## Usage Information

You cannot use Class D or Class E IP addresses or zero IP address (0.0.0.0) when creating a static ARP. Zero MAC addresses (00:00:00:00:00:00) are also invalid.

You can use the `vrf` attribute of this command to create a static ARP entry on either a default or a non-default VRF. You cannot use this parameter to create any static ARPs corresponding to management VRFs. When a VRF is deleted using the `no ip vrf` command, all the static ARP configurations that belong to that VRF are removed automatically.

## Related Commands

[clear arp-cache](#) — clears dynamic ARP entries from the ARP table.

[show arp](#) — displays the ARP table.

## arp backoff-time

Set the exponential timer for resending unresolved ARPs.

### S4820T

**Syntax**            `arp backoff-time seconds`

| <b>Parameters</b>        | <i>seconds</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Enter the number of seconds an ARP entry is black-holed. The range is from 1 to 3600. The default is <b>30</b> . |         |             |          |                             |         |                          |          |                           |          |                          |         |                          |

| <b>Usage Information</b> | This timer is an exponential backoff timer. Over the specified period, the time between ARP requests increases. This behavior reduces the potential for the system to slow down while waiting for a multitude of ARP responses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                  |         |             |          |                             |         |                          |          |                           |          |                          |         |                          |
| <b>Related Commands</b>  | <a href="#">show arp retries</a> — displays the configured number of ARP retries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                  |         |             |          |                             |         |                          |          |                           |          |                          |         |                          |

## arp learn-enable

Enable ARP learning using gratuitous ARP.

### S4820T

|                        |                                                                                                                                                                                                                                                                 |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>arp learn-enable</code>                                                                                                                                                                                                                                   |
| <b>Defaults</b>        | Disabled                                                                                                                                                                                                                                                        |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                                                                                                                   |
| <b>Command History</b> | <p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> |

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 8.3.1.0  | Introduced.                 |

### Usage Information

In Dell Networking OS versions prior to 8.3.1.0, if a gratuitous ARP is received some time after an ARP request is sent, only RP2 installs the ARP information. For example:

1. At time t=0, Dell Networking OS sends an ARP request for IP *A.B.C.D*.
2. At time t=1, Dell Networking OS receives an ARP request for IP *A.B.C.D*.
3. At time t=2, Dell Networking OS installs an ARP entry for *A.B.C.D* only on RP2.

Beginning with Dell Networking OS version 8.3.1.0, when a gratuitous ARP is received, Dell Networking OS installs an ARP entry on all three CPUs.

## arp max-entries

Enables you to configure the maximum number of ARP entries per VRF that are allowed for IPv4..

### S4820T

#### Syntax

```
arp max-entries [vrf vrf-name] max-number
```

#### Parameters

- |                            |                                                                                                                  |
|----------------------------|------------------------------------------------------------------------------------------------------------------|
| <b><i>vrf vrf-name</i></b> | Enter the name of a specific VRF for which you want to configure maximum number of ARP entries that IPv4 allows. |
| <b><i>max-number</i></b>   | Enter the maximum number of ARP entries that a VRF RTM can hold. The range is from 0 to 65535.                   |

#### Defaults

Not configured.

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                         |
|-----------|-------------------------------------|
| 9.7(0.0)  | Introduced on the S6000-ON.         |
| 9.4.(0.0) | Introduced on the S4810 and S4820T. |

**Usage Information**

Use this command to specify the maximum number of ARP entries that the Route Table Manager can hold for a specific VRF. This command does not apply to the management VRFs.

## arp retries

Set the number of ARP retries in case the system does not receive an ARP reply in response to an ARP request.

### S4820T

**Syntax** `arp retries number`

**Parameters** *number* Enter the number of retries. The range is from 1 to 20. The default is **5**.

**Defaults** **5**

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 8.3.1.0  | Introduced.                 |

**Usage Information**

Retries are 20 seconds apart.

**Related Commands**

[show arp retries](#) — displays the configured number of ARP retries.

# arp timeout

Set the time interval for an ARP entry to remain in the ARP cache.

## S4820T

**Syntax** `arp timeout minutes`

**Parameters** `minutes` Enter the number of minutes. The range is from 0 to 35790. The default is **240 minutes**.

**Defaults** **240 minutes** (4 hours)

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                          |
|-------------|--------------------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON.          |
| 9.0.2.0     | Introduced on the S6000.             |
| 8.3.19.0    | Introduced on the S4820T.            |
| 8.3.11.1    | Introduced on the Z9000.             |
| 8.3.7.0     | Introduced on the S4810.             |
| 8.1.1.0     | Introduced on the E-Series ExaScale. |
| 7.6.1.0     | Introduced on the S-Series.          |
| 7.5.1.0     | Introduced on the C-Series.          |
| pre-6.2.1.1 | Introduced on the E-Series.          |

**Related Commands** [show interfaces](#) — displays the ARP timeout value for all available interfaces.

# clear arp-cache

Clear the dynamic ARP entries from a specific interface or optionally delete (`no-refresh`) ARP entries from the content addressable memory (CAM).

## S4820T

**Syntax** `clear arp-cache [vrf vrf-name | interface | ip ip-address] [no-refresh]`

### Parameters

**vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` and then the name of the VRF to clear the ARP cache corresponding to that VRF.

**interface** (OPTIONAL) Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For the Management interface on the stack-unit, enter the keyword `ManagementEthernet` then the slot/port information. The slot range is from 0 to 1. The port range is 0.
- For a port channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**ip ip-address** (OPTIONAL) Enter the keyword `ip` then the IP address of the ARP entry you wish to clear.

**no-refresh** (OPTIONAL) Enter the keywords `no-refresh` to delete the ARP entry from CAM. Or use this option with `interface` or `ip ip-address` to specify which dynamic ARP entries you want to delete.

**NOTE:** Transit traffic may not be forwarded during the period when deleted ARP entries are resolved again and re-installed in CAM. Use this option with extreme caution.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                                                                       |
|-------------|-----------------------------------------------------------------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON.                                                       |
| 9.4.(0.0)   | Added support for VRF.                                                            |
| 9.0.2.0     | Introduced on the S6000.                                                          |
| 8.3.19.0    | Introduced on the S4820T.                                                         |
| 8.3.11.1    | Introduced on the Z9000.                                                          |
| 8.5.1.0     | Added support for 4-port 40G line cards on ExaScale.                              |
| 8.3.7.0     | Introduced on the S4810.                                                          |
| 8.2.1.0     | Added support for 4094 VLANs on the E-Series ExaScale (the prior limit was 2094). |
| 8.1.1.0     | Introduced on the E-Series ExaScale.                                              |
| 7.9.1.0     | Introduced VRF on the E-Series.                                                   |
| 7.6.1.0     | Introduced on the S-Series.                                                       |
| 7.5.1.0     | Introduced on the C-Series.                                                       |
| pre-6.2.1.1 | Introduced on the E-Series.                                                       |

## clear host

Remove one or all dynamically learned host table entries.

### S4820T

**Syntax** `clear host name`

**Parameters**

|                    |                                                                                 |
|--------------------|---------------------------------------------------------------------------------|
| <b><i>name</i></b> | Enter the name of the host to delete. Enter * to delete all host table entries. |
|--------------------|---------------------------------------------------------------------------------|

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |

| Version  | Description                          |
|----------|--------------------------------------|
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.3.7.0  | Introduced on the S4810.             |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 7.6.1.0  | Introduced on the S-Series.          |
| 7.5.1.0  | Introduced on the C-Series.          |

## clear ip fib stack-unit

Clear all FIB entries in the specified stack unit (use this command with caution, refer to *Usage Information*.)

**Syntax** `clear ip fib stack-unit unit-number vrf vrf-name`

**Parameters**

|                            |                                                                                                                        |
|----------------------------|------------------------------------------------------------------------------------------------------------------------|
| <b><i>unit-number</i></b>  | Enter the number of the stack unit.                                                                                    |
| <b><i>vrf vrf-name</i></b> | Enter the keyword <code>vrf</code> followed by the name of the VRF to clear all FIB entries corresponding to that VRF. |

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.4(0.0) | Added support for VRF.      |
| 9.0.2.0  | Introduced on the S6000.    |
| 9.0.0.0  | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 8.3.19.0 | Introduced on the S4820T.   |

**Usage Information** To clear Layer 3 CAM inconsistencies, use this command.

**CAUTION: Executing this command causes traffic disruption.**

**Related  
Commands**

show ip fib stack-unit — shows FIB entries on a specified stack-unit.

## clear ip route

Clear one or all routes in the routing table.

### S4820T

**Syntax**

```
clear ip route [vrf vrf-name] { * | ip-address mask }
```

**Parameters**

|                               |                                                                                                                           |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b><i>vrf vrf-name</i></b>    | (Optional) Enter the keyword <code>vrf</code> and then the name of the VRF to clear the routes corresponding to that VRF. |
| <b>*</b>                      | Enter an asterisk (*) to clear all learned IP routes.                                                                     |
| <b><i>ip-address mask</i></b> | Enter a specific IP address and mask in dotted decimal format to clear that IP address from the routing table.            |

**Command  
Modes**

EXEC Privilege

**Command  
History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                          |
|-------------|--------------------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON.          |
| 9.4.(0.0)   | Added support for VRF.               |
| 9.0.2.0     | Introduced on the S6000.             |
| 8.3.19.0    | Introduced on the S4820T.            |
| 8.3.11.1    | Introduced on the Z9000.             |
| 8.3.7.0     | Introduced on the S4810.             |
| 8.1.1.0     | Introduced on the E-Series ExaScale. |
| 7.9.1.0     | Introduced VRF on the E-Series.      |
| 7.6.1.0     | Introduced on the S-Series.          |
| 7.5.1.0     | Introduced on the C-Series.          |
| pre-6.2.1.1 | Introduced on the E-Series.          |

**Usage Information**

Use the `vrf vrf-name` attribute of this command to clear routes corresponding to either a specific VRF or the default VRF.

You cannot use this attribute to clear routes corresponding to a management VRF.

**Related Commands**

[ip route](#) — assigns an IP route to the switch.

[show ip route](#) — views the routing table.

[show ip route summary](#) — views a summary of the routing table.

## clear tcp statistics

Clear TCP counters.

### S4820T

**Syntax**

```
clear tcp statistics [all | cp | rp1 | rp2]
```

**Parameters**

- all** Enter the keyword `all` to clear all TCP statistics maintained on all switch processors.
- cp** (OPTIONAL) Enter the `cp` to clear only statistics from the Control Processor.
- rp1** (OPTIONAL) Enter the keyword `rp1` to clear only the statistics from Route Processor 1.
- rp2** (OPTIONAL) Enter the keyword `rp2` to clear only the statistics from Route Processor 2.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |

| Version     | Description                 |
|-------------|-----------------------------|
| 8.3.7.0     | Introduced on the S4810.    |
| 7.6.1.0     | Introduced on the S-Series. |
| 7.5.1.0     | Introduced on the C-Series. |
| pre-6.2.1.1 | Introduced on the E-Series. |

## debug arp

View information on ARP transactions.

### S4820T

#### Syntax

```
debug arp [interface] [count value]
```

To stop debugging ARP transactions, use the `no debug arp` command.

#### Parameters

##### *interface*

(OPTIONAL) Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For the Management interface on the stack-unit, enter the keyword `ManagementEthernet` then the slot/port information. The slot range is from 0 to 1. The port range is 0.
- For a port channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

##### *count value*

(OPTIONAL) Enter the keyword `count` then the count value. The range is from 1 to 65534.

#### Defaults

none

#### Command Modes

EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                       |
|----------|-----------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                       |
| 9.0.2.0  | Introduced on the S6000.                                                          |
| 8.3.19.0 | Introduced on the S4820T.                                                         |
| 8.3.11.1 | Introduced on the Z9000.                                                          |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale.                              |
| 8.3.7.0  | Introduced on the S4810.                                                          |
| 8.2.1.0  | Added support for 4094 VLANs on the E-Series ExaScale (the prior limit was 2094). |
| 8.1.1.0  | Introduced on the E-Series ExaScale.                                              |
| 7.6.1.0  | Introduced on the S-Series.                                                       |
| 7.5.1.0  | Introduced on the C-Series.                                                       |
| 6.3.1.0  | Added the <code>count</code> option.                                              |

**Usage Information**

To stop packets from flooding the user terminal when debugging is turned on, use the `count` option.

## debug ip dhcp

Enable debug information for dynamic host configuration protocol (DHCP) relay transactions and display the information on the console.

### S4820T

**Syntax**

`debug ip dhcp`

To disable debug, use the `no debug ip dhcp` command.

**Defaults**

Debug disabled

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |

| Version  | Description                                          |
|----------|------------------------------------------------------|
| 8.3.19.0 | Introduced on the S4820T.                            |
| 8.3.11.1 | Introduced on the Z9000.                             |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale. |
| 8.3.7.0  | Introduced on the S4810.                             |
| 8.1.1.0  | Introduced on the E-Series ExaScale.                 |
| 7.6.1.0  | Introduced on the S-Series.                          |
| 7.5.1.0  | Introduced on the C-Series.                          |
| 6.4.10   | Introduced on the E-Series.                          |

### Example

```
Dell#debug ip dhcp
00:12:21 : %RELAY-I-PACKET: BOOTP REQUEST (Unicast) received
at interface 113.3.3.17 BOOTP
Request, hops = 0, XID = 0xbf05140f, secs = 0, hwaddr =
00:60:CF:20:7B:8C, giaddr = 0.0.0.0

### Related Commands

[ip helper-address](#) – specifies the destination broadcast or host address for the DHCP server request.

[ip helper-address hop-count disable](#) – disables the hop-count increment for the DHCP relay agent.

## debug ip icmp

View information on the internal control message protocol (ICMP).

### S4820T

#### Syntax

```
debug ip icmp [interface] [count value]
```

To disable debugging, use the `no debug ip icmp` command.

#### Parameters

##### *interface*

(OPTIONAL) Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For the Management interface on the stack-unit, enter the keyword `ManagementEthernet` then the slot/port information. The slot range is from 0 to 1. The port range is 0.
- For a port channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

##### *count value*

(OPTIONAL) Enter the keyword `count` then the count value. The range is from 1 to 65534. The default is **Infinity**.

EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |

| Version  | Description                                                                       |
|----------|-----------------------------------------------------------------------------------|
| 8.3.11.1 | Introduced on the Z9000.                                                          |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale.                              |
| 8.3.7.0  | Introduced on the S4810.                                                          |
| 8.2.1.0  | Added support for 4094 VLANs on the E-Series ExaScale (the prior limit was 2094). |
| 8.1.1.0  | Introduced on the E-Series ExaScale.                                              |
| 7.6.1.0  | Introduced on the S-Series.                                                       |
| 7.5.1.0  | Introduced on the C-Series.                                                       |
| 6.3.1.0  | Added the <code>count</code> option.                                              |

#### Example

```
ICMP: echo request rcvd from src 40.40.40.40
ICMP: src 40.40.40.40, dst 40.40.40.40, echo reply
ICMP: src 40.40.40.40, dst 40.40.40.40, echo reply
ICMP: echo request sent to dst 40.40.40.40
ICMP: echo request rcvd from src 40.40.40.40
ICMP: src 40.40.40.40, dst 40.40.40.40, echo reply
ICMP: src 40.40.40.40, dst 40.40.40.40, echo reply
ICMP: echo request sent to dst 40.40.40.40
```

#### Usage Information

To stop packets from flooding the user terminal when debugging is turned on, use the `count` option.

## debug ip packet

View a log of IP packets sent and received.

### S4820T

#### Syntax

```
debug ip packet [access-group name] [count value] [interface]
```

To disable debugging, use the `no debug ip packet [access-group name] [count value] [interface]` command.

#### Parameters

|                          |                                                                                                                                                                |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>access-group name</b> | Enter the keyword <code>access-group</code> then the access list name (maximum 16 characters) to limit the debug output based on the defined rules in the ACL. |
| <b>count value</b>       | (OPTIONAL) Enter the keyword <code>count</code> then the count value. The range is from 1 to 65534. The default is <code>Infinity</code> .                     |
| <b>interface</b>         | (OPTIONAL) Enter the following keywords and slot/port or number information:                                                                                   |

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For the Management interface on the stack-unit, enter the keyword `ManagementEthernet` then the slot/port information. The slot range is from 0 to 1. The port range is 0.
- For a port channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                       |
|----------|-----------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                       |
| 9.0.2.0  | Introduced on the S6000.                                                          |
| 8.3.19.0 | Introduced on the S4820T.                                                         |
| 8.3.11.1 | Introduced on the Z9000.                                                          |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale.                              |
| 8.3.7.0  | Introduced on the S4810.                                                          |
| 8.2.1.0  | Added support for 4094 VLANs on the E-Series ExaScale (the prior limit was 2094). |
| 8.1.1.0  | Introduced on the E-Series ExaScale.                                              |
| 7.6.1.0  | Added the <code>access-group</code> option.                                       |
| 7.6.1.0  | Introduced on the S-Series.                                                       |
| 7.5.1.0  | Introduced on the C-Series.                                                       |
| 6.3.1.0  | Added the <code>count</code> option.                                              |

**Usage Information**

The following describes the `debug ip packet` command in the following example.

| Field           | Description                                                                                                     |
|-----------------|-----------------------------------------------------------------------------------------------------------------|
| <code>s=</code> | Lists the source address of the packet and the name of the interface (in parentheses) that received the packet. |

| Field                                                                                 | Description                                                                                                                                                                                                   |
|---------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>d=</b>                                                                             | Lists the destination address of the packet and the name of the interface (in parentheses) through which the packet is being sent out on the network.                                                         |
| <b>len</b>                                                                            | Displays the packet's length.                                                                                                                                                                                 |
| <b>sending, rcvd,<br/>fragment, sending<br/>broad/multicast<br/>proto, unroutable</b> | The last part of each line lists the status of the packet.                                                                                                                                                    |
| <b>TCP src=</b>                                                                       | Displays the source and destination ports, the sequence number, the acknowledgement number, and the window size of the packets in that TCP packets.                                                           |
| <b>UDP src=</b>                                                                       | Displays the source and destination ports for the UDP packets.                                                                                                                                                |
| <b>ICMP type=</b>                                                                     | Displays the ICMP type and code.                                                                                                                                                                              |
| <b>IP Fragment</b>                                                                    | States that it is a fragment and displays the unique number identifying the fragment (Ident) and the offset (in 8-byte units) of this fragment (fragment offset) from the beginning of the original datagram. |

#### Example

```

IP: s=10.1.2.62 (local), d=10.1.2.206 (Ma 0/0), len 54, sending
    TCP src=23, dst=40869, seq=2112994894, ack=606901739,
    win=8191 ACK PUSH
IP: s=10.1.2.206 (Ma 0/0), d=10.1.2.62, len 40, rcvd
    TCP src=0, dst=0, seq=0, ack=0, win=0
IP: s=10.1.2.62 (local), d=10.1.2.206 (Ma 0/0), len 226,
    sending
    TCP src=23, dst=40869, seq=2112994896, ack=606901739,
    win=8192 ACK PUSH
IP: s=10.1.2.216 (Ma 0/0), d=10.1.2.255, len 78, rcvd
    UDP src=0, dst=0
IP: s=10.1.2.62 (local), d=10.1.2.3 (Ma 0/0), len 1500,
    sending fragment
    IP Fragment, Ident = 4741, fragment offset = 0
    ICMP type=0, code=0
IP: s=10.1.2.62 (local), d=10.1.2.3 (Ma 0/0), len 1500,
    sending fragment
    IP Fragment, Ident = 4741, fragment offset = 1480
IP: s=40.40.40.40 (local), d=224.0.0.5 (Gi 4/11), len 64,
    sending broad/multicast
    proto=89
IP: s=40.40.40.40 (local), d=224.0.0.6 (Gi 4/11), len 28,
    sending broad/multicast
    proto=2
IP: s=0.0.0.0, d=30.30.30.30, len 100, unroutable
    ICMP type=8, code=0
IP: s=0.0.0.0, d=30.30.30.30, len 100, unroutable
    ICMP type=8, code=0

```

#### Usage Information

To stop packets from flooding the user terminal when debugging is turned on, use the `count` option.

The `access-group` option supports only the equal to (`eq`) operator in TCP ACL rules. Port operators not equal to (`neq`), greater than (`gt`), less than (`lt`), or `range` are not supported in `access-group` option (refer to the following example). ARP packets (`arp`) and Ether-type (`ether-type`) are also not supported in the `access-group` option. The entire rule is skipped to compose the filter.

The `access-group` option pertains to:

- IP protocol number: from 0 to 255
- Internet control message protocol (`icmp`) but not the ICMP message type (from 0 to 255)
- Any internet protocol (`ip`)
- Transmission Control Protocol (`tcp`) but not on the `rst`, `syn`, or `urg` bits
- User Datagram Protocol (`udp`)

In the case of ambiguous access control list rules, the `debug ip packet access-control` command is disabled. A message appears identifying the error (refer to the Example below).

#### Example (Error Messages)

```
Dell#debug ip packet access-group test
%Error: port operator GT not supported in access-list debug
%Error: port operator LT not supported in access-list debug
%Error: port operator RANGE not supported in access-list debug
%Error: port operator NEQ not supported in access-list debug

Dell#00:10:45: %RPM0-P:CP
%IPMGR-3-DEBUG_IP_PACKET_ACL_AMBIGUOUS_EXP: Ambiguous rules not
supported in access-list debug, access-list debugging is
turned off
Dell#
```

## ip address

Assign a primary and secondary IP address to the interface.

### S4820T

#### Syntax

```
ip address ip-address mask [secondary]
```

To delete an IP address from an interface, use the `no ip address [ip-address]` command.

#### Parameters

|                          |                                                                                                           |
|--------------------------|-----------------------------------------------------------------------------------------------------------|
| <b><i>ip-address</i></b> | Enter an IP address in dotted decimal format.                                                             |
| <b><i>mask</i></b>       | Enter the mask of the IP address in slash prefix format (for example, /24).                               |
| <b><i>secondary</i></b>  | (OPTIONAL) Enter the keyword <code>secondary</code> to designate the IP address as the secondary address. |

| <b>Defaults</b>          | Not configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |         |             |          |                             |         |                          |          |                           |          |                          |         |                          |         |                                      |         |                             |         |                             |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------|----------|-----------------------------|---------|--------------------------|----------|---------------------------|----------|--------------------------|---------|--------------------------|---------|--------------------------------------|---------|-----------------------------|---------|-----------------------------|
| <b>Command Modes</b>     | INTERFACE                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |         |             |          |                             |         |                          |          |                           |          |                          |         |                          |         |                                      |         |                             |         |                             |

|                        |                                                                                                                                                                                                                                                                 |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <pre>ip directed-broadcast</pre> <p>To disable the interface from receiving directed broadcast packets, use the <code>no ip directed-broadcast</code> command.</p>                                                                                              |
| <b>Defaults</b>        | Disabled (that is, the interface does not receive directed broadcast packets)                                                                                                                                                                                   |
| <b>Command Modes</b>   | INTERFACE                                                                                                                                                                                                                                                       |
| <b>Command History</b> | <p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> |

| Version  | Description                          |
|----------|--------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.          |
| 9.0.2.0  | Introduced on the S6000.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.3.7.0  | Introduced on the S4810.             |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 7.6.1.0  | Introduced on the S-Series.          |
| 7.5.1.0  | Introduced on the C-Series.          |

## ip domain-list

Configure names to complete unqualified host names.

### S4820T

#### Syntax

```
ip domain-list name
```

To remove the name, use the `no ip domain-list name` command.

#### Parameters

***name***

Enter a domain name to be used to complete unqualified names (that is, incomplete domain names that cannot be resolved).

#### Defaults

Disabled.

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |

| Version | Description                          |
|---------|--------------------------------------|
| 8.3.7.0 | Introduced on the S4810.             |
| 8.1.1.0 | Introduced on the E-Series ExaScale. |
| 7.6.1.0 | Introduced on the S-Series.          |
| 7.5.1.0 | Introduced on the C-Series.          |

### Usage Information

To configure a list of possible domain names, configure the `ip domain-list` command up to six times.

If you configure both the `ip domain-name` and `ip domain-list` commands, the software tries to resolve the name using the `ip domain-name` command. If the name is not resolved, the software goes through the list of names configured with the `ip domain-list` command to find a match.

To enable dynamic resolution of hosts, use the following steps:

- specify a domain name server with the `ip name-server` command
- enable DNS with the `ip domain-lookup` command

To view current bindings, use the `show hosts` command. To view a DNS-related configuration, use the `show running-config resolve` command.

### Related Commands

[ip domain-name](#) — specifies a DNS server.

## ip domain-lookup

To address resolution (that is, DNS), enable dynamic host-name.

### S4820T

#### Syntax

`ip domain-lookup`

To disable DNS lookup, use the `no ip domain-lookup` command.

#### Defaults

Disabled.

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                          |
|----------|--------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.          |
| 9.0.2.0  | Introduced on the S6000.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.3.7.0  | Introduced on the S4810.             |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 7.6.1.0  | Introduced on the S-Series.          |
| 7.5.1.0  | Introduced on the C-Series.          |

#### Usage Information

To fully enable DNS, also specify one or more domain name servers with the `ip name-server` command.

Dell Networking OS does not support sending DNS queries over a VLAN. DNS queries are sent out all other interfaces, including the Management port.

To view current bindings, use the `show hosts` command.

#### Related Commands

[ip name-server](#) — specifies a DNS server.

[show hosts](#) — Views the current bindings.

## ip domain-name

Configure one domain name for the switch.

### S4820T

#### Syntax

`ip domain-name name`

To remove the domain name, use the `no ip domain-name` command.

#### Parameters

***name***

Enter one domain name to be used to complete unqualified names (that is, incomplete domain names that cannot be resolved).

#### Defaults

Not configured.

#### Command Modes

CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                          |
|----------|--------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.          |
| 9.0.2.0  | Introduced on the S6000.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.3.7.0  | Introduced on the S4810.             |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 7.6.1.0  | Introduced on the S-Series.          |
| 7.5.1.0  | Introduced on the C-Series.          |

## Usage Information

You can only configure one domain name with the `ip domain-name` command. To configure more than one domain name, configure the `ip domain-list` command up to six times.

To enable dynamic resolution of hosts, use the following steps:

- specify a domain name server with the `ip name-server` command
- enable DNS with the `ip domain-lookup` command

To view current bindings, use the `show hosts` command.

## Related Commands

[ip domain-list](#) — configures additional names.

# ip helper-address

Specify the address of a DHCP server so that DHCP broadcast messages can be forwarded when the DHCP server is not on the same subnet as the client.

## S4820T

### Syntax

```
ip helper-address ip-address
```

To remove a DHCP server address, use the `no ip helper-address` command.

### Parameters

***ip-address*** Enter an IP address in dotted decimal format (A.B.C.D).

**Defaults** Not configured.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| <b>Version</b>     | <b>Description</b>                   |
|--------------------|--------------------------------------|
| <b>9.7(0.0)</b>    | Introduced on the S6000-ON.          |
| <b>9.0.2.0</b>     | Introduced on the S6000.             |
| <b>9.0.0.0</b>     | Added support for IPv6.              |
| <b>8.3.19.0</b>    | Introduced on the S4820T.            |
| <b>8.3.11.1</b>    | Introduced on the Z9000.             |
| <b>8.3.7.0</b>     | Introduced on the S4810.             |
| <b>8.1.1.0</b>     | Introduced on the E-Series ExaScale. |
| <b>7.9.1.0</b>     | Introduced VRF on the E-Series.      |
| <b>7.6.1.0</b>     | Introduced on the S-Series.          |
| <b>7.5.1.0</b>     | Introduced on the C-Series.          |
| <b>pre-6.2.1.1</b> | Introduced on the E-Series.          |

**Usage Information**

You can add multiple DHCP servers by entering the `ip helper-address` command multiple times. If multiple servers are defined, an incoming request is sent simultaneously to all configured servers and the reply is forwarded to the DHCP client.

Dell Networking OS uses standard DHCP ports, that is UDP ports 67 (server) and 68 (client) for DHCP relay services. It listens on port 67 and if it receives a broadcast, the software converts it to unicast, and forwards to it to the DHCP-server with source port=68 and destination port=67.

The server replies with source port=67, destination port=67 and Dell Networking OS forwards to the client with source port=67, destination port=68.

# ip helper-address hop-count disable

Disable the hop-count increment for the DHCP relay agent.

## S4820T

**Syntax** `ip helper-address hop-count disable`  
To re-enable the hop-count increment, use the `no ip helper-address hop-count disable` command.

**Defaults** Enabled; the hops field in the DHCP message header is incremented by default.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                          |
|----------|--------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.          |
| 9.0.2.0  | Introduced on the S6000.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.3.7.0  | Introduced on the S4810.             |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 7.6.1.0  | Introduced on the S-Series.          |
| 7.5.1.0  | Introduced on the C-Series.          |
| 6.3.1.0  | Introduced for the E-Series.         |

**Usage Information** This command disables the incrementing of the hops field when boot requests are relayed to a DHCP server through Dell Networking OS. If the incoming boot request already has a non-zero hops field, the message is relayed with the same value for hops. However, the message is discarded if the hops field exceeds 16, to comply with the relay agent behavior specified in RFC 1542.

**Related Commands** [ip helper-address](#) — specifies the destination broadcast or host address for DHCP server requests.

[show running-config](#) — displays the current configuration and changes from the default values.

# ip host

Assign a name and an IP address to the host-to-IP address mapping table.

## S4820T

### Syntax

```
ip host name ip-address
```

To remove an IP host, use the `no ip host name [ip-address]` command.

### Parameters

|                          |                                                                          |
|--------------------------|--------------------------------------------------------------------------|
| <b><i>name</i></b>       | Enter a text string to associate with one IP address.                    |
| <b><i>ip address</i></b> | Enter an IP address, in dotted decimal format, to be mapped to the name. |

### Defaults

Not configured.

### Command Modes

CONFIGURATION

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                          |
|-------------|--------------------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON.          |
| 9.0.2.0     | Introduced on the S6000.             |
| 8.3.19.0    | Introduced on the S4820T.            |
| 8.3.11.1    | Introduced on the Z9000.             |

| 7.6.1.0     | Introduced on the S-Series.          |
| 7.5.1.0     | Introduced on the C-Series.          |
| pre-6.1.1.0 | Introduced for the E-Series.         |

## ip icmp source-interface

Enable the ICMP error and unreachable messages to be sent with the source interface IP address, such as the loopback address, instead of the hops of the preceding devices along the network path to be used for easy debugging and diagnosis of network disconnections and reachability problems with IPv4 packets.

**Syntax** `ip icmp source-interface interface`

**Parameters** *interface* Enter one of the following keywords and slot/port or number information:

- For a Management Ethernet interface, enter the keyword `managementethernet`.

 **NOTE:** When you configure the capability to enable the loopback IP address to be sent for easy debugging and diagnosis (IP addresses of the devices for which the ICMP source interface is configured), the source IP address of the outgoing ICMP error message is modified, although the packets are not sent out using the configured interface. Because the management interface is configured without any parameters such as the IP address, it is treated to the management interface of the primary unit or the existing unit.

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

| <b>Command History</b> | <b>Version</b> | <b>Description</b>                                           |
|------------------------|----------------|--------------------------------------------------------------|
|                        | 9.7(0.0)       | Introduced on the S6000-ON.                                  |
|                        | 9.3(0.0)       | Introduced on the S4810, S4820T, S6000, and Z9000 platforms. |

**Usage Information** You can enable the mechanism to configure the source or the originating interface from which the packet (the device that generates the ICMP error messages) is received by the switch to send the loopback address instead of its source IP

address to be used in the ICMP unreachable messages and in the `traceroute` command output. The loopback address must be unique in a particular domain.

In network environments that contain a large number of devices, ranging up to thousands of systems, and with each device configured for equal-cost multipath (ECMP) links, you cannot effectively and optimally use the `traceroute` and `ping` applications to examine the network reachability and identify any broken links for diagnostic purposes. In such cases, if the reply that is obtained from each hop on the network path contains the IP address of the adjacent, neighboring interface from which the packet is received, it is difficult to employ the `ping` and `traceroute` utilities. You can enable the ICMP unreachable messages to contain the loopback address of the source device instead of the previous hop's IP address to be able to easily and quickly identify the device and devices along the path because the DNS server maps the loopback IP address to the hostname and does not translate the IP address of every interface of the switch to the hostname.

#### Example

```
Dell(conf)#ip icmp source-interface tengigabitethernet 1/1
Dell(conf)#
```

## ipv6 icmp source-interface

Enable the ICMP error and unreachable messages to be sent with the source interface IP address, such as the loopback address, instead of the hops of the preceding devices along the network path to be used for easy debugging and diagnosis of network disconnections and reachability problems with IPv6 packets.

**Syntax** `ipv6 icmp source-interface interface`

#### Parameters

***interface***

Enter one of the following keywords and slot/port or number information:

- For a Management Ethernet interface, enter the keyword `managementethernet`.

**NOTE:** When you configure the capability to enable the loopback IP address to be sent for easy debugging and diagnosis (IP addresses of the devices for which the ICMP source interface is configured), the source IP address of the outgoing ICMP error message is modified, although the packets are not sent out using the configured interface. Because the management interface is configurable only without any parameters such as the IP address, it is treated to the management interface of the primary unit or the existing unit.

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.

- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

| Command History | Version  | Description                                                  |
|-----------------|----------|--------------------------------------------------------------|
|                 | 9.7(0.0) | Introduced on the S6000-ON.                                  |
|                 | 9.3(0.0) | Introduced on the S4810, S4820T, S6000, and Z9000 platforms. |

**Usage Information** You can enable the mechanism to configure the source or the originating interface from which the packet (the device that generates the ICMP error messages) is received by the switch to send the loopback address instead of its source IP address to be used in the ICMP unreachable messages and in the `tracert` command output. The loopback address must be unique in a particular domain.

In network environments that contain a large number of devices, ranging up to thousands of systems, and with each device configured for equal-cost multipath (ECMP) links, you cannot effectively and optimally use the `tracert` and `ping` applications to examine the network reachability and identify any broken links for diagnostic purposes. In such cases, if the reply that is obtained from each hop on the network path contains the IP address of the adjacent, neighboring interface from which the packet is received, it is difficult to employ the `ping` and `tracert` utilities. You can enable the ICMP unreachable messages to contain the loopback address of the source device instead of the previous hop's IP address to be able to easily and quickly identify the device and devices along the path because the DNS server maps the loopback IP address to the hostname and does not translate the IP address of every interface of the switch to the hostname.

**Example**

```
Dell(conf)#ipv6 icmp source-interface tengigabitethernet 1/1
Dell(conf)#
```

## ip max-frag-count

Set the maximum number of fragments allowed in one packet for packet re-assembly.

### S4820T

**Syntax** `ip max-frag-count count`

To place no limit on the number of fragments allowed, use the `no ip max-frag-count` command.

**Parameters**

**count** Enter a number for the number of fragments allowed for re-assembly. The range is from 2 to 256.

**Defaults**

No limit is set on number of fragments allowed.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                          |
|-------------|--------------------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON.          |
| 9.0.2.0     | Introduced on the S6000.             |
| 8.3.19.0    | Introduced on the S4820T.            |
| 8.3.11.1    | Introduced on the Z9000.             |
| 8.3.7.0     | Introduced on the S4810.             |
| 8.1.1.0     | Introduced on the E-Series ExaScale. |
| 7.6.1.0     | Introduced on the S-Series.          |
| 7.5.1.0     | Introduced on the C-Series.          |
| pre-6.1.1.0 | Introduced for the E-Series.         |

**Usage Information**

To avoid denial of service (DOS) attacks, keep the number of fragments allowed for re-assembly low.

## ip max-routes

Enables you to configure the maximum number of protocol routes per VRF that are allowed for IPv4.

### S4820T

**Syntax**

```
ip max-routes [vrf vrf-name] max-number
```

**Parameters**

**vrf vrf-name** Enter the keyword `vrf` and then the name of the VRF for which you want to configure maximum number of protocol routes that IPv4 allows.

|                          |                                                                                                                                                                                                                                                                 |                                                                                                   |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
|                          | <b><i>max-number</i></b>                                                                                                                                                                                                                                        | Enter the maximum number of protocol routes that a VRF RTM can hold. The range is from 0 to 7500. |
| <b>Defaults</b>          | Not configured.                                                                                                                                                                                                                                                 |                                                                                                   |

## ip mtu

Set the IP MTU (frame size) of the packet the RPM transmits for the line card interface. If the packet must be fragmented, Dell Networking OS sets the size of the fragmented packets to the size specified in this command.

### S4820T

|                        |                                                                                                                                                                                                                                                                 |                                                                                                                              |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>ip mtu value</code>                                                                                                                                                                                                                                       | To return to the default IP MTU value, use the <code>no ip mtu</code> command.                                               |

| Version  | Description                          |
|----------|--------------------------------------|
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.7.0  | Introduced on the S4810.             |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 6.1.1.0  | Introduced on the E-Series.          |

**Usage Information**

When you enter the `no mtu` command, Dell Networking OS reduces the `ip mtu` value to 1536 bytes. To return the IP MTU value to the default, use the `no ip mtu` command.

Starting with Dell Networking OS Release 9.2(0.2), the `ip mtu` command is not supported to configure the IP MTU value that is used when the IP packet is fragmented. Instead of having to configure the IP MTU value, this value is automatically computed by the software when you configure an interface. As a result, the `ip mtu` command is not available for configuration. However, you can continue to specify the link MTU value by using the `mtu` command.

Compensate for Layer 2 header when configuring link MTU on an Ethernet interface or Dell Networking OS may not fragment packets. If the packet includes a Layer 2 header, the difference between the link MTU and IP MTU (the `ip mtu` command) must be enough bytes to include for the Layer 2 header.

Link MTU and IP MTU considerations for Port Channels and VLANs are as follows

**Port Channels:**

- All members must have the same link MTU value and the same IP MTU value.
- The Port Channel link MTU and IP MTU must be less than or equal to the link MTU and IP MTU values configured on the channel members. For example, if the members have a link MTU of 2100 and an IP MTU 2000, the Port Channel's MTU values cannot be higher than 2100 for link MTU or 2000 bytes for IP MTU.

**VLANs:**

- All members of a VLAN must have same IP MTU value.
- Members can have different Link MTU values. Tagged members must have a link MTU 4 bytes higher than untagged members to account for the packet tag.
- The VLAN link MTU and IP MTU must be less than or equal to the link MTU and IP MTU values configured on the VLAN members. For example, the VLAN contains tagged members with Link MTU of 1522 and IP MTU of 1500 and untagged members with Link MTU of 1518 and IP MTU of 1500. The VLAN's Link MTU cannot be higher than 1518 bytes and its IP MTU cannot be higher than 1500 bytes.

The following describes the difference between Link MTU and IP MTU.

| Layer 2 Overhead    | Difference between Link MTU and IP MTU |
|---------------------|----------------------------------------|
| Ethernet (untagged) | 18 bytes                               |
| VLAN Tag            | Tag 22 bytes                           |

|                                        |                                        |
|----------------------------------------|----------------------------------------|
| Layer 2 Overhead                       | Difference between Link MTU and IP MTU |
| Untagged Packet with VLAN-Stack Header | 22 bytes                               |
| Tagged Packet with VLAN-Stack Header   | 26 bytes                               |

**Related Commands**      [mtu](#) – sets the link MTU for an Ethernet interface.

## ip name-server

Enter up to six IPv4 addresses of name servers. The order you enter the addresses determines the order of their use.

### S4820T

**Syntax**      `ip name-server ipv4-address [ipv4-address2...ipv4-address6]`  
 To remove a name server, use the `no ip name-server ip-address` command.

**Parameters**

|                                      |                                                                                                                                          |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ipv4-address</i>                  | Enter the IPv4 address, in dotted decimal format, of the name server to be used.                                                         |
| <i>ipv4-address2...ipv4-address6</i> | (OPTIONAL) Enter up five more IPv4 addresses, in dotted decimal format, of name servers to be used. Separate the addresses with a space. |

**Defaults**      No name servers are configured.

**Command Modes**      CONFIGURATION

**Command History**      This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |

| Version     | Description                          |
|-------------|--------------------------------------|
| 8.3.11.1    | Introduced on the Z9000.             |
| 8.3.7.0     | Introduced on the S4810.             |
| 8.1.1.0     | Introduced on the E-Series ExaScale. |
| 7.6.1.0     | Introduced on the S-Series.          |
| 7.5.1.0     | Introduced on the C-Series.          |
| pre-6.1.1.0 | Introduced on the E-Series.          |

#### Usage Information

Dell Networking OS does not support sending DNS queries over a VLAN. DNS queries are sent out on all other interfaces, including the Management port.

You can separately configure both IPv4 and IPv6 domain name servers.

## ip proxy-arp

Enable proxy ARP on an interface.

### S4820T

#### Syntax

`ip proxy-arp`

To disable proxy ARP, use the `no ip proxy-arp` command.

#### Defaults

Enabled.

#### Command Modes

INTERFACE

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                          |
|----------|--------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.          |
| 9.0.2.0  | Introduced on the S6000.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.3.7.0  | Introduced on the S4810.             |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |

| Version     | Description                 |
|-------------|-----------------------------|
| 7.6.1.0     | Introduced on the S-Series. |
| 7.5.1.0     | Introduced on the C-Series. |
| pre-6.1.1.0 | Introduced on the E-Series. |

**Related Commands** [show ip interface](#) — displays the interface routing status and configuration.

## ip route

Assign a static route to the switch.

### S4820T

**Syntax**

```
ip route [vrf vrf-name] ip-address mask {ip-address | interface
[ip-address]} [distance] [permanent] [tag tag-value] [vrf vrf-
name] [weight weight-value]
```

To delete a specific static route, use the `no ip route destination mask` command.

To delete all routes matching a certain route, use the `no ip route destination mask` command.

### Parameters

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf vrf-name</b> | (Optional) Enter the keyword <code>vrf</code> and then the name of the VRF to configure a static route corresponding to that VRF. Use this VRF option after the <code>ip route</code> keyword to configure a static route on that particular VRF.                                                                                                                                                                                                                              |
| <b>destination</b>  | Enter the IP address in dotted decimal format of the destination device.                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>mask</b>         | Enter the mask in the slash prefix format (/x) of the destination IP address.                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>ip-address</b>   | Enter the IP address of the forwarding router in dotted decimal format.                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>interface</b>    | Enter one of the following keyword followed by the slot/port number: <ul style="list-style-type: none"> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li> </ul> |

- For the Management interface on the stack-unit, enter the keyword `ManagementEthernet` then the slot/port information. The slot range is from 0 to 1. The port range is 0.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a Null interface, enter the keyword `null` then the Null interface number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- For a tunnel interface, enter the keyword `tunnel` then the tunnel interface number. The range is from 1 to 16383.

If you configure a static IPv6 route using an egress interface and enter the ping command to reach the destination IPv6 address, the ping operation may not work. Configure the IPv6 route using a next-hop IPv6 address in order for the ping command to detect the destination address.

|                             |                                                                                                                                                                                                                                                                                                                               |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>interface ip-address</b> | Enter the keyword <code>interface</code> then the IP address.                                                                                                                                                                                                                                                                 |
| <b>distance</b>             | (OPTIONAL) Enter the value of the distance metric assigned to the route. The range is from 1 to 255.                                                                                                                                                                                                                          |
| <b>permanent</b>            | (OPTIONAL) Enter the keyword <code>permanent</code> to specify that the route must not be removed even if the interface assigned to that route goes down. The route must be currently active to be installed in the routing table. If you disable the interface, the route is removed from the routing table.                 |
| <b>tag tag-value</b>        | (OPTIONAL) Enter the keyword <code>tag</code> then a number to assign to the route. The range is from 1 to 4294967295.                                                                                                                                                                                                        |
| <b>vrf vrf-name</b>         | Enter the keyword <code>vrf</code> followed by the name of the VRF. Use this VRF option after the next hop to specify which VRF the next hop belongs to. This setting is used in route leaking cases. Refer to the Route Leaking VRFs section in the Virtual Routing and Forwarding (VRF) chapter of the Configuration guide. |
| <b>weight weight-value</b>  | Enter the keyword <code>weight</code> followed by a weight value. The range is from 0 to 255.                                                                                                                                                                                                                                 |

**NOTE:** Weight for a static route can be added only for the destination address and not for the route pointing to destination a interface.

|                      |                 |

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                                                                       |
|-------------|-----------------------------------------------------------------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON.                                                       |
| 9.7(0.0)    | Included the <code>weighted</code> parameter to support weighted ECMP feature.    |
| 9.4(0.0)    | Added support for VRF.                                                            |
| 9.0.2.0     | Introduced on the S6000.                                                          |
| 9.2(0.0)    | Added support for tunnel interface type.                                          |
| 8.3.19.0    | Introduced on the S4820T.                                                         |
| 8.3.11.1    | Introduced on the Z9000.                                                          |
| 8.5.1.0     | Added support for 4-port 40G line cards on ExaScale.                              |
| 8.3.7.0     | Introduced on the S4810.                                                          |
| 8.2.1.0     | Added support for 4094 VLANs on the E-Series ExaScale (the prior limit was 2094). |
| 8.1.1.0     | Introduced on the E-Series ExaScale.                                              |
| 7.9.1.0     | Introduced VRF on the E-Series.                                                   |
| 7.6.1.0     | Introduced on the S-Series.                                                       |
| 7.5.1.0     | Introduced on the C-Series.                                                       |
| pre-6.1.1.0 | Introduced on the E-Series.                                                       |

## Usage Information

Using the following example of a static route: `ip route 33.33.33.0 /24 tengigabitethernet 1/1 172.31.5.43`

- The software installs a next hop that is not on the directly connected subnet but which recursively resolves to a next hop on the interface's configured subnet. In the example, if `tengig 1/1` has an ip address on subnet `2.2.2.0` and if `172.31.5.43` recursively resolves to `2.2.2.0`, Dell Networking OS installs the static route.
- When the interface goes down, Dell Networking OS withdraws the route.
- When the interface comes up, Dell Networking OS re-installs the route.
- When recursive resolution is "broken," Dell Networking OS withdraws the route.
- When recursive resolution is satisfied, Dell Networking OS re-installs the route.

You can specify a weight for an IPv4 or IPv6 static route. If the weight value of a path is 0, then that path is not used for forwarding when weighted ECMP is in effect. Also, if a path corresponding to a static route (destination) has a non-zero weight assigned to it and other paths do not have any weight configured, then regular ECMP is used for forwarding.

You can specify the weight value only to destination address and not on the egress port.

A route is considered for weighted ECMP calculations only if each paths corresponding to that route is configured with a weight.

You cannot use the VRF attribute of this command to configure routes in a management VRF. When a specific VRF is deleted, all the configured static routes corresponding to that VRF are automatically removed.

### Example

```
Dell(conf)#ip route 1.1.1.0/24 4.4.4.2 weight 100
Dell(conf)#ip route 1.1.1.0/24 6.6.6.2 weight 200
Dell(conf)#do show running-config | grep route ip route
1.1.1.0/24 4.4.4.2 weight 100 ip route 1.1.1.0/24 6.6.6.2
weight 200
Dell(conf)#ip route vrf test 1.1.1.0/24 4.4.4.2 weight 100
Dell(conf)#ip route vrf test 1.1.1.0/24 6.6.6.2 weight 200
Dell(conf)#
Dell(conf)#do show running-config | grep route ip route vrf
test 1.1.1.0/24 4.4.4.2 weight 100 ip route vrf test
1.1.1.0/24 6.6.6.2 weight 200
```

### Related Commands

[show ip route](#) — views the switch routing table.

## ip source-route

Enable Dell Networking OS to forward IP packets with source route information in the header.

### S4820T

**Syntax** `ip source-route`  
To drop packets with source route information, use the `no ip route-source` command.

**Defaults** Enabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |

| Version     | Description                          |
|-------------|--------------------------------------|
| 9.0.2.0     | Introduced on the S6000.             |
| 8.3.19.0    | Introduced on the S4820T.            |
| 8.3.11.1    | Introduced on the Z9000.             |
| 8.3.7.0     | Introduced on the S4810.             |
| 8.1.1.0     | Introduced on the E-Series ExaScale. |
| 7.6.1.0     | Introduced on the S-Series.          |
| 7.5.1.0     | Introduced on the C-Series.          |
| pre-6.1.1.0 | Introduced on the E-Series.          |

## ip tcp initial-time

Define the wait duration in seconds for the TCP connection to be established. This command is supported on the , S4820T, , and platforms.

**Syntax** `ip tcp initial-time <8-75>`  
 To restore the default behavior, which causes the wait period to be set as 8 seconds, use the `no ip tcp initial-time` command.

**Parameters** `<8-75>` Wait duration in seconds for the TCP connection to be established.

**Command Modes** CONFIGURATION

**Command History**

| Version  | Description                                                  |
|----------|--------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                  |
| 9.3(0.0) | Introduced on the S4810, S4820T, S6000, and Z9000 platforms. |

**Usage Information** You can configure the amount of time for which the device must wait before it attempts to establish a TCP connection. Using this capability, you can limit the wait times for TCP connection requests. Upon responding to the initial SYN packet that requests a connection to the router for a specific service (such as SSH or BGP) with a SYN ACK, the router waits for a period of time for the ACK packet to be sent from the requesting host that will establish the TCP connection.

## show ip tcp initial-time

Displays the interval that you configured for the device to wait before the TCP connection is attempted to be established.

**Syntax** `show ip tcp initial-time`

**Command Modes** EXEC

EXEC Privilege

**Command History**

**Version**

**Description**

9.7(0.0)

Introduced on the S6000-ON.

9.3(0.0)

Introduced on the S4810, S4820T, S6000, Z9000, and MXL platforms.

## ip unreachable

Enable the generation of internet control message protocol (ICMP) unreachable messages.

### S4820T

**Syntax** `ip unreachable`

To disable the generation of ICMP messages, use the `no ip unreachable` command.

**Defaults** Disabled.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

**Version**

**Description**

9.7(0.0)

Introduced on the S6000-ON.

9.0.2.0

Introduced on the S6000.

8.3.19.0

Introduced on the S4820T.

8.3.11.1

Introduced on the Z9000.

| Version     | Description                          |
|-------------|--------------------------------------|
| 8.3.7.0     | Introduced on the S4810.             |
| 8.1.1.0     | Introduced on the E-Series ExaScale. |
| 7.6.1.0     | Introduced on the S-Series.          |
| 7.5.1.0     | Introduced on the C-Series.          |
| pre-6.1.1.0 | Introduced on the E-Series.          |

## load-balance

By default, for C-Series and S-Series, Dell Networking OS uses an IP 4-tuple (IP SA, IP DA, Source Port, and Destination Port) to distribute IP traffic over members of a Port Channel as well as equal-cost paths. To designate another method to balance traffic over Port Channel members, use the `load-balance` command.

### S4820T

#### Syntax

```
load-balance {ip-selection [dest-ip | source-ip]} | {mac [dest-mac | source-dest-mac | source-mac]} | {tcp-udp | ingress-port [enable]}
```

To return to the default setting (IP 4-tuple), use the `no load-balance {ip-selection [dest-ip | source-ip]} | {mac [dest-mac | source-dest-mac | source-mac]} | {tcp-udp | ingress-port [enable]}` command.

#### Parameters

##### ip-selection {dest-ip | source-ip}

Enter the keywords to distribute IP traffic based on the following criteria:

- `dest-ip` — Uses destination IP address and destination port fields to hash. The hashing mechanism returns a 3-bit index indicating which port the packet should be forwarded.
- `source-ip` — Uses source IP address and source port fields to hash. The hashing mechanism returns a 3-bit index indicating which port the packet should be forwarded.

##### mac {dest-mac | source-dest- mac | source- mac}

Enter the keywords to distribute MAC traffic based on the following criteria:

- `dest-mac` — Uses the destination MAC address, VLAN, Ethertype, source module ID and source port ID fields to hash. The hashing mechanism returns a 3-bit index indicating which port the packet should be forwarded.
- `source-dest-mac` — Uses the destination and source MAC address, VLAN, Ethertype, source module ID and

source port ID fields to hash. The hashing mechanism returns a 3-bit index indicating which port the packet should be forwarded.

- `source-mac` — Uses the source MAC address, VLAN, Ethertype, source module ID and source port ID fields to hash. The hashing mechanism returns a 3-bit index indicating which port the packet should be forwarded.

**tcp-udp enable**

Enter the keywords to distribute traffic based on the following:

- `enable` — Takes the TCP/UDP source and destination ports into consideration when doing hash computations. This option is enabled by default.

**ingress-port enable**

Enter the keywords to distribute traffic based on the following:

- `enable` — Takes the source port into consideration when doing hash computations. This option is disabled by default.

**Defaults**

IP 4-tuple (IP SA, IP DA, Source Port, Destination Port)

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                  |
|----------|--------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                  |
| 9.0.2.0  | Introduced on the S6000.                                     |
| 8.3.19.0 | Introduced on the S4820T.                                    |
| 8.3.11.1 | Introduced on the Z9000.                                     |
| 8.3.10.0 | Added the <code>ingress-port</code> parameter for the S4810. |
| 8.3.7.0  | Introduced on the S4810.                                     |
| 7.6.1.0  | Introduced on the S-Series.                                  |
| 7.5.1.0  | Introduced on the C-Series.                                  |

**Usage Information**

By default, Dell Networking OS distributes incoming traffic based on a hash algorithm using the following criteria:

- IP source address
- IP destination address
- TCP/UDP source port

- TCP/UDP destination port

## load-balance hg

Choose the traffic flow parameters the hash calculation uses while distributing the traffic across internal higit links.

### Syntax

```
[no] load-balance hg {ip-selection | ipv6-selection [source-ip
| source-ipv6 | source-port-id | source-module-id | dest-ip |
dest-ipv6 | dest-port-id | dest-module-id | protocol | vlan |
L4-source-port | L4-dest-port ] | mac [source-mac | source-
port-id | source-module-id | dest-mac | dest-port-id | dest-
module-id | vlan | ethertype | source-dest-mac ] | tunnel
[ipv4-over-ipv4 | ipv4-over-gre-ipv4 | mac-in-mac]}
```

### Parameters

```
{ip-selection|
ipv6-selection
[source-ip |
source-ipv6 |
source-port-id
| source-
module-id |
dest-ip | dest-
ipv6 | dest-
port-id | dest-
module-id |
protocol | vlan |
L4-source-port
| L4-dest-port }
```

To use IPv4 key fields in hash computation, enter the keyword `ip-selection` then one of the parameters. To use IPv6 key fields in hash computation, enter the keyword `ipv6-selection` then one of the parameters.

- `source-ip` — Use IPv4 `src-ip` field in hash calculation.
- `source-ipv6` — Use IPv6 `src-ip` field in hash calculation
- `source-port-id` — Use `src-port-id` field in hash calculation.
- `source-module-id` — Use `src-module-id` field in hash calculation.
- `dest-ip` — Use IPv4 `dest-ip` field in hash calculation.
- `dest-ipv6` — Use IPv6 `dest-ip` field in hash calculation
- `dest-port-id` — Use `dest-port-id` field in hash calculation.
- `dest-module-id` — Use `dest-module-id` field in hash calculation.
- `protocol` — Use IPv4 `protocol` field in hash calculation.
- `vlan` — Use `vlan` field in hash calculation.
- `L4-source-port` — Use IPv4 `L4-source-port` field in hash calculation.
- `L4-dest-port` — Use IPv4 `L4-dest-port` field in hash calculation.

**mac** [*source-mac* | *source-port-id* | *source-module-id* | *dest-mac* | *dest-port-id* | *dest-module-id* | *vlan* | *ethertype* | *source-dest-mac* ]

To use MAC key fields in hash computation, enter the keyword `mac` then one of the parameters:

- `source-mac` — Use `source-mac` field in hash calculation.
- `source-port-id` — Use `src-port-id` field in hash calculation.
- `source-module-id` — Use `src-module-id` field in hash calculation.
- `dest-mac` — Use `dest-mac` field in hash calculation.
- `dest-port-id` — Use `dest-port-id` field in hash calculation.
- `dest-module-id` — Use `dest-module-id` field in hash calculation.
- `vlan` — Use `vlan` field in hash calculation .
- `ethertype` — Use `Ethertype` field in hash calculation.
- `source-dest-mac` — Use `SMAC` and `DMAC` fields in hash calculation.

**tunnel** [*ipv4-over-ipv4* | *ipv4-over-gre-ipv4* | *mac-in-mac*]

To use tunnel key fields in hash computation, enter the keyword `tunnel` then one of the parameters:

- `ipv4-over-ipv4` — Use `ipv4-over-ipv4` field in hash calculation.
- `ipv4-over-gre-ipv4` — Use `ipv4-over-gre-ipv4` field in hash calculation.
- `mac-in-mac` — Use `mac-in-mac` field in hash calculation.

**Defaults**

IP selection 5-tuples (source-ip dest-ip vlan protocol L4-source-port L4-dest-port).

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 9.0.0.0  | Added support for IPv6.     |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |

# management route

Configure a static route that points to the Management interface or a forwarding router.

## S4820T

### Syntax

```
management route {{ip-address mask | {ipv6-address prefix-length}} {forwarding-router-address | managementethernet | fortyGigE | vlan | tengigabitethernet}
```

To remove a static route, use the `no management route` {{ip-address mask | {ipv6-address prefix-length}}{forwarding-router-address | managementethernet | fortyGigE | vlan | gigabitethernet | tengigabitethernet} command.

### Parameters

**ip-address mask** Enter an IP address (dotted decimal format) and mask (/prefix format) of the destination subnet.

**ipv6-address prefix-length** Enter an IPv6 address (x:x:x:x format) and mask (/prefix format) of the destination subnet. Enter the IPv6 address in the x:x:x:x format followed by the prefix length in the /x format.  
The range is from /0 to /128.

**NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

**forwarding-router-address** Enter an IP address (dotted decimal format) or an IPv6 address (x:x:x:x format) of a forwarding router.

**managementethernet** Enter the keyword `managementethernet` for the Management interface on the Primary RPM.

**fortyGigE** Enter the keyword `fortyGigE` to specify a forty Gigbit Ethernet interface.

**vlan** Enter the keyword `vlan` to specify a vlan interface.

**tengigabitethernet** Enter the keyword `tengigabitethernet` to specify a ten Gigabit Ethernet interface.

### Defaults

Not configured.

### Command Modes

CONFIGURATION

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                                                                                            |
|-------------|--------------------------------------------------------------------------------------------------------|
| 9.7(0.0)    | Added support for forty gigabit, vlan, and tengigabit ethernet interfaces. Introduced on the S6000-ON. |
| 9.0.2.0     | Introduced on the S6000.                                                                               |
| 9.0.0.0     | Introduced on the Z9000 and added support for IPv6.                                                    |
| 8.3.19.0    | Introduced on the S4820T.                                                                              |
| 8.3.11.1    | Introduced on the S4810.                                                                               |
| 8.1.1.0     | Introduced on the E-Series ExaScale.                                                                   |
| 7.5.1.0     | Introduced on the C-Series.                                                                            |
| pre-6.1.1.0 | Introduced on the E-Series.                                                                            |

### Usage Information

When a static route (or a protocol route) overlaps with Management static route, the static route (or a protocol route) is preferred over the Management Static route. Also, Management static routes and the Management Connected prefix are not reflected in the hardware routing tables. Separate routing tables are maintained for IPv4 and IPv6 management routes. This command manages both tables.

### Related Commands

[interface ManagementEthernet](#) — configures the Management port on the system (either the Primary or Standby RPM).

[speed \(Management interface\)](#) — sets the speed for the Management interface.

## show arp

Display the ARP table.

### S4820T

#### Syntax

```
show arp [vrf vrf-name] [interface interface | ip ip-address
[mask] | macaddress mac-address [mac-address mask]] [retries]
[static | dynamic] [inspection {database | statistics}][summary]
```

#### Parameters

**vrf *vrf-name*** (OPTIONAL) Enter the keyword `vrf` and then the name of the VRF.

**NOTE:** Use this attribute to start a BGP instance for either a specific address family corresponding to the default VRF or an IPv4 address family corresponding to a non-default VRF.

**interface *interface*** (OPTIONAL) Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For the Management interface on the stack-unit, enter the keyword `ManagementEthernet` then the slot/port information. The slot range is from 0 to 1. The port range is 0.
- For a port channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

|                                                 |                                                                                                                                                                                                                                                                                     |
|-------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><code>ip ip-address mask</code></b>          | (OPTIONAL) Enter the keyword <code>ip</code> then an IP address in the dotted decimal format. Enter the optional IP address mask in the slash prefix format ( <code>/ x</code> ).                                                                                                   |
| <b><code>inspection</code></b>                  | Enter the keyword <code>inspection</code> with one of the following keywords to view ARP entries: <ul style="list-style-type: none"> <li>• <code>database</code> — view a list of ARP entries learned using DAI</li> <li>• <code>statistics</code> — view DAI statistics</li> </ul> |
| <b><code>macaddress mac-address mask</code></b> | (OPTIONAL) Enter the keyword <code>macaddress</code> then a MAC address in <code>nn:nn:nn:nn:nn:nn</code> format. Enter the optional MAC address mask in <code>nn:nn:nn:nn:nn</code> format also.                                                                                   |
| <b><code>static</code></b>                      | (OPTIONAL) Enter the keyword <code>static</code> to view entries entered manually.                                                                                                                                                                                                  |
| <b><code>retries</code></b>                     | (OPTIONAL) Enter the keyword <code>retries</code> to show the number of ARP retries before a 20-second back off.                                                                                                                                                                    |
| <b><code>dynamic</code></b>                     | (OPTIONAL) Enter the keyword <code>dynamic</code> to view dynamic entries.                                                                                                                                                                                                          |
| <b><code>summary</code></b>                     | (OPTIONAL) Enter the keyword <code>summary</code> to view a summary of ARP entries.                                                                                                                                                                                                 |

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                                                                                     |
|-----------|-------------------------------------------------------------------------------------------------|
| 9.7(0.0)  | Introduced on the S6000-ON.                                                                     |
| 9.4.(0.0) | Added support for VRF and added usage information for the <code>clear arp-cache</code> command. |

| Version     | Description                                                                       |
|-------------|-----------------------------------------------------------------------------------|
| 9.0.2.0     | Introduced on the S6000.                                                          |
| 8.3.19.0    | Introduced on the S4820T.                                                         |
| 8.3.11.1    | Introduced on the Z9000.                                                          |
| 8.5.1.0     | Added support for 4-port 40G line cards on ExaScale.                              |
| 8.3.7.0     | Introduced on the S4810.                                                          |
| 8.2.1.0     | Added support for 4094 VLANs on the E-Series ExaScale (the prior limit was 2094). |
| 8.1.1.0     | Introduced on the E-Series ExaScale.                                              |
| 7.9.1.0     | Introduced VRF on the E-Series.                                                   |
| 7.8.1.0     | Augmented to display local ARP entries learned from private VLANs (PVLANS).       |
| 7.6.1.0     | Introduced on the S-Series.                                                       |
| 7.5.1.0     | Introduced on the C-Series.                                                       |
| pre-6.1.1.0 | Introduced on the E-Series.                                                       |

#### Usage Information

The following example shows two VLANs that are associated with a private VLAN (PVLAN) (refer to [Private VLAN \(PVLAN\)](#)).

If you have entered the `clear arp-cache` command to remove a large number of ARP entries and the command is still being processed in the background, an error message display if you attempt to enter the `show arp` command:

```
Clear arp in-progress. Please try after sometime!
```

The following describes the `show arp` command shown in the following example.

#### Description

|                         |                                                                                                        |
|-------------------------|--------------------------------------------------------------------------------------------------------|
| <b>Protocol</b>         | Displays the protocol type.                                                                            |
| <b>Address</b>          | Displays the IP address of the ARP entry.                                                              |
| <b>Age(min)</b>         | Displays the age (in minutes) of the ARP entry.                                                        |
| <b>Hardware Address</b> | Displays the MAC address associated with the ARP entry.                                                |
| <b>Interface</b>        | Displays the first two letters of the interfaces type and the slot/port associated with the ARP entry. |
| <b>VLAN</b>             | Displays the VLAN ID, if any, associated with the ARP entry.                                           |
| <b>CPU</b>              | Lists which CPU the entries are stored on.                                                             |

#### Example

```
Dell>show arp
Protocol  Address  Age(min)  Hardware Address  Interface  VLAN  CPU
-----
Internet  192.2.1.254  1  00:00:c0:02:01:02  Te 2/13  -  CP
Internet  192.2.1.253  1  00:00:c0:02:01:02  Te 2/13  -  CP
Internet  192.2.1.252  1  00:00:c0:02:01:02  Te 2/13  -  CP
```

```

Internet 192.2.1.251 1 00:00:c0:02:01:02 Te 2/13 - CP
Internet 192.2.1.250 1 00:00:c0:02:01:02 Te 2/13 - CP
Internet 192.2.1.251 1 00:00:c0:02:01:02 Te 2/13 - CP
Internet 192.2.1.250 1 00:00:c0:02:01:02 Te 2/13 - CP

- CP

```

**Usage  
Information**

The following describes the `show arp summary` command shown in the following example.

**Description**

- Total Entries** Lists the total number of ARP entries in the ARP table.
- Static Entries** Lists the total number of configured or static ARP entries.
- Dynamic Entries** Lists the total number of learned or dynamic ARP entries.
- CPU** Lists which CPU the entries are stored on.

**Example  
(Summary)**

```

#show arp summary
TotalEntries Static Entries Dynamic Entries CPU
-----
83 0 83 CP
Dell

```

**Related  
Commands**

- [ip local-proxy-arp](#) — enables/disables Layer 3 communication in secondary VLANs.
- [switchport mode private-vlan](#) — sets PVLAN mode of the selected port.

## show arp retries

Display the configured number of ARP retries.

### S4820T

**Syntax** `show arp retries`

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.1.0  | Introduced.                 |

**Related Commands** [arp retries](#) — sets the number of ARP retries in case the system does not receive an ARP reply in response to an ARP request.

## show hosts

View the host table and DNS configuration.

### S4820T

**Syntax** `show hosts`

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                          |
|-------------|--------------------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON.          |
| 9.0.2.0     | Introduced on the S6000.             |
| 9.0.0.0     | Added support for IPv6 addresses.    |
| 8.3.19.0    | Introduced on the S4820T.            |
| 8.3.11.1    | Introduced on the Z9000.             |
| 8.1.1.0     | Introduced on the E-Series ExaScale. |
| 7.6.1.0     | Introduced on the S-Series.          |
| 7.5.1.0     | Introduced on the C-Series.          |
| pre-6.1.1.0 | Introduced on the E-Series.          |

### Usage Information

The following describes the `show hosts` command in the following example.

| Field                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Default domain...      | Displays the domain name (if configured).                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Name/address lookup... | States if DNS is enabled on the system. <ul style="list-style-type: none"> <li>• If DNS is enabled, the Name/Address lookup is domain service.</li> <li>• If DNS is not enabled, the Name/Address lookup is static mapping</li> </ul>                                                                                                                                                                                                                                                          |
| Name servers are...    | Lists the name servers, if configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Host                   | Displays the host name assigned to the IP address.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Flags                  | Classifies the entry as one of the following: <ul style="list-style-type: none"> <li>• perm — the entry was manually configured and will not time out</li> <li>• temp — the entry was learned and will time out after 72 hours of inactivity.</li> </ul> <p>Also included in the flag is an indication of the validity of the route:</p> <ul style="list-style-type: none"> <li>• ok — the entry is valid.</li> <li>• ex — the entry expired.</li> <li>• ?? — the entry is suspect.</li> </ul> |
| TTL                    | Displays the amount of time until the entry ages out of the cache. For dynamically learned entries only.                                                                                                                                                                                                                                                                                                                                                                                       |
| Type                   | Displays IP as the type of entry.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Address                | Displays the IP addresses assigned to the host.                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Example

```
Dell#show hosts
Default domain is not set
Name/address lookup uses static mappings
Name servers are not set
Host      Flags      TTL      Type      Address
-----
ks        (perm, OK) -      IP        2.2.2.2
4200-1    (perm, OK) -      IP        192.68.69.2
1230-3    (perm, OK) -      IP        192.68.99.2
ZZr       (perm, OK) -      IP        192.71.18.2
Z10-3     (perm, OK) -      IP        192.71.23.1
Dell#
```

## Related Commands

[traceroute](#) — views the DNS resolution.

[ip host](#) — configures a host.

# show ip cam linecard

View CAM entries for a port pipe on a line card.

## S4820T

### Syntax

```
show ip cam linecard number port-set pipe-number [ip-address
mask [longer-prefixes] | index index-number | summary | vrf vrf
instance]
```

### Parameters

|                                                                 |                                                                                                                                                                       |
|-----------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>number</i></b>                                            | Enter the number of the line card.                                                                                                                                    |
| <b><i>pipe-number</i></b>                                       | Enter the number of the line card's port-pipe. The range is from 0 to 1.                                                                                              |
| <b><i>ip-address</i><br/><i>mask</i> [<i>longer-prefix</i>]</b> | (OPTIONAL) Enter the IP address and mask of a route to CAM entries for that route only. Enter the keyword <i>longer-prefixes</i> to view routes with a common prefix. |
| <b>index <i>index-number</i></b>                                | (OPTIONAL) Enter the keyword <i>index</i> then the CAM index number. The range depends on CAM size.                                                                   |
| <b>summary</b>                                                  | (OPTIONAL) Enter the keyword <i>summary</i> to view a table listing route prefixes and the total number of routes that can be entered into the CAM.                   |
| <b><i>vrf instance</i></b>                                      | (OPTIONAL) E-Series Only: Enter the keyword <i>vrf</i> then the VRF instance name to show CAM information as it applies to that VRF instance.                         |

### Command Modes

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

|                            |                                            |
|----------------------------|--------------------------------------------|
| <b>Version 8.3.19.0</b>    | Introduced on the S4820T.                  |
| <b>Version 8.3.7.0</b>     | Introduced on the S4810.                   |
| <b>Version 8.1.1.2</b>     | Introduced on the E-Series ExaScale E600i. |
| <b>Version 8.1.1.0</b>     | Introduced on the E-Series ExaScale.       |
| <b>Version 7.9.1.0</b>     | Introduced VRF on the E-Series.            |
| <b>Version 7.5.1.0</b>     | Introduced on the C-Series.                |
| <b>pre-Version 6.1.1.0</b> | Introduced on the E-Series.                |

## Usage Information

The following describes the `show ip cam` command shown in the following example.

| Field              | Description                                                                                                                                                                                                                                                                                                          |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Index</b>       | Displays the CAM index number of the entry.                                                                                                                                                                                                                                                                          |
| <b>Destination</b> | Displays the destination route of the index.                                                                                                                                                                                                                                                                         |
| <b>EC</b>          | Displays the number of equal cost multipaths (ECMP) available for the default route for non-Jumbo line cards. For Jumbo line cards, displays 0,1 when ECMP is more than eight.                                                                                                                                       |
| <b>CG</b>          | Displays 0.                                                                                                                                                                                                                                                                                                          |
| <b>V</b>           | Displays a 1 if the entry is valid and a 0 if the entry is for a line card with Catalog number beginning with LC-EF.                                                                                                                                                                                                 |
| <b>C</b>           | Displays the CPU bit. 1 indicates that a packet hitting this entry is forwarded to the CP or RP2, depending on Egress port.                                                                                                                                                                                          |
| <b>Next-Hop</b>    | Displays the next hop IP address of the entry.                                                                                                                                                                                                                                                                       |
| <b>Vld</b>         | Displays the VLAN ID. If the entry is 0, the entry is not part of a VLAN.                                                                                                                                                                                                                                            |
| <b>Mac Addr</b>    | Displays the next-hop router's MAC address.                                                                                                                                                                                                                                                                          |
| <b>Port</b>        | Displays the egress interface. Use the second half of the entry to determine the interface. For example, in the entry 17cl CP, the CP is the pertinent portion. <ul style="list-style-type: none"><li>• CP = control processor</li><li>• RP2 = route processor 2</li><li>• Gi = Gigabit Ethernet interface</li></ul> |

- | Field | Description                          |
|-------|--------------------------------------|
|       | • So = SONET interface               |
|       | • Te = 10-Gigabit Ethernet interface |

**Example**

```
Dell#show ip cam linecard 13 port-set 0
Index  Destination EC CG V C  Next-Hop  VId Mac-Addr  Port
-----
3276   6.6.6.2      0 0 1 1   0.0.0.0  0 00:00:00:00:00:00 17c1 CP

**Usage Information**

The following describes the show ip cam summary command shown in the following example.

- | Field                | Description                                                                                                                                                                                 |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Prefix Length</b> | Displays the prefix-length or mask for the IP address configured on the linecard 0 port pipe 0.                                                                                             |
| <b>Current Use</b>   | Displays the number of routes currently configured for the corresponding prefix or mask on the linecard 0 port pipe 0.                                                                      |
| <b>Initial Size</b>  | Displays the CAM size Dell Networking OS allocates for the corresponding mask. Dell Networking OS adjusts the CAM size if the number of routes for the mask exceeds the initial allocation. |

**Example (Summary)**

```
Dell#show ip cam linecard 4 port-set 0 summary
Total Number of Routes in the CAM is 13
Total Number of Routes which can be entered in CAM is 131072
```

| Prefix Len | Current Use | Initial Sz |
|------------|-------------|------------|
| -----      |             |            |
| 32         | 7           | 37994      |
| 31         | 0           | 1312       |
| 30         | 0           | 3932       |
| 29         | 0           | 1312       |
| 28         | 0           | 1312       |
| 27         | 0           | 1312       |
| 26         | 0           | 1312       |
| 25         | 0           | 1312       |

Dell#

```

## show ip cam stack-unit

Display CAM entries for a port-pipe of a stack-unit on a S-Series or Z-Series switch.

### Syntax

```

show ip cam stack-unit {stack-unit-number} [port-set {pipe-
number} | vrf vrf-name {ip-address mask [longer-prefixes [ecmp-
group detail]]}]| ecmp-group {detail | member-info [detail
[group-index index-number]]}| summary]

```

### Parameters

|                                                                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>stack-unit-number</i></b>                                                                                        | Enter the stack-unit ID.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>port-set <i>pipe-number</i></b>                                                                                     | Enter the keyword <code>port-set</code> then the number of the stack unit's port-pipe. The unit ID range is from 0 to 0.                                                                                                                                                                                                                                                                                                                                   |
| <b><i>network mask</i> [<i>longer-prefixes</i> [<i>ecmp-group detail</i>]]</b>                                         | (OPTIONAL) Enter the IP address and mask of a route to CAM entries for that route only. You can enter one of the following keywords to filter results. <ul style="list-style-type: none"> <li>Enter the keyword <code>longer-prefixes</code> to view routes with a common prefix.</li> <li>Enter the keyword <code>ecmp-group detail</code> to view the ECMP group index.</li> </ul>                                                                       |
| <b><i>ecmp-group</i> {<i>detail</i>   <i>member-info</i> [<i>detail</i> [<i>group-index</i> <i>index-number</i>]]}</b> | (OPTIONAL) Enter the keyword <code>ecmp-group</code> then one of the following keywords to filter results. <ul style="list-style-type: none"> <li>Enter the keyword <code>detail</code> to view the ECMP group index.</li> <li>Enter the keyword <code>member-info</code> to view the member information for the ECMP group.</li> <li>Enter the keyword <code>member-info detail</code> to view detailed ECMP membership and n-hop information.</li> </ul> |

- Enter the keyword `group-index` then the index number to show ECMP membership per group. The range is from 0 to 1022.

**summary** (OPTIONAL) Enter the keyword `summary` to view a table listing route prefixes and the total number routes which can be entered in to CAM.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                  |
|----------|----------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                  |
| 9.4(0.0) | Added support for VRF.                       |
| 8.3.19.0 | Introduced on the S4820T.                    |
| 8.3.11.1 | Introduced on the Z9000.                     |
| 8.3.7.0  | Introduced on the S4810.                     |
| 7.7.1.0  | Added support for up to seven stack members. |
| 7.6.1.0  | Introduced on the S-Series.                  |

**Usage Information**

The following describes the `show ip cam` command shown in the following example.

| Field              | Description                                                                                                                                                                                        |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Destination</b> | Displays the destination route of the index.                                                                                                                                                       |
| <b>EC</b>          | Displays 1 if the route is an ECMP route. Else, displays 0.                                                                                                                                        |
| <b>C</b>           | This is the CPU bit. If it displays 1, then it indicates that a packet hitting this entry will be forwarded to the CPU.                                                                            |
| <b>V Id</b>        | Displays the VLAN ID. If the entry is 0, the entry is not part of a VLAN.                                                                                                                          |
| <b>Mac Addr</b>    | Displays the next-hop router's MAC address.                                                                                                                                                        |
| <b>Port</b>        | Displays the egress interface. <ul style="list-style-type: none"> <li>• CP = control processor</li> <li>• Gi = Gigabit Ethernet interface</li> <li>• Te = 10-Gigabit Ethernet interface</li> </ul> |

**Example**

```
Dell#show ip cam stack-unit 3 po 0 1.1.1.0/24 longer-prefixes
```

| Destination        | EC | C | VId  | Mac-Addr          | Port |
|--------------------|----|---|------|-------------------|------|

| Field       | Description                                                                                                                             |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Destination | Lists the destination IP address.                                                                                                       |
| Gateway     | Displays either the word "direct" and an interface for a directly connected route or the remote IP address used to forward the traffic. |
| First-Hop   | Displays the first hop IP address.                                                                                                      |
| Mac-Addr    | Displays the MAC address.                                                                                                               |
| Port        | Displays the egress-port information.                                                                                                   |
| Vld         | Displays the VLAN ID. If no VLAN is assigned, zero (0) is listed.                                                                       |
| Index       | Displays the internal interface number.                                                                                                 |
| EC          | Displays the number of ECMP paths.                                                                                                      |

### Example

```
Dell>show ip fib linecard 12

Destination      Gateway                First-Hop    Mac-Addr
Port    Vld Index EC
-----
3.0.0.0/8        via 100.10.10.10, So 2/8 100.10.10.10
00:01:e8:00:03:ff So 2/8 0 60260 0
3.0.0.0/8        via 101.10.10.10, So 2/9
00.10.10.0/24   Direct, So 2/8 0.0.0.0
00:01:e8:00:03:ff So 2/8 0 11144 0
100.10.10.1/32  via 127.0.0.1 127.0.0.1
00:00:00:00:00:00 CP      0 3276 0
100.10.10.10/32 via 100.10.10.10, So 2/8 100.10.10.10
00:01:e8:00:03:ff So 2/8 0 0 0
101.10.10.0/24  Direct, So 2/9 0.0.0.0
00:00:00:00:00:00 RP2    0 11145 0
101.10.10.1/32  via 127.0.0.1 127.0.0.1
00:00:00:00:00:00 CP      0 3277 0
101.10.10.10/32 via 101.10.10.10, So 2/9 101.10.10.10
00:01:e8:01:62:32 So 2/9 0 1 0
Dell>
```

## show ip fib stack-unit

View all Forwarding Information Base (FIB) entries of a specific stack-unit.

### S4820T

#### Syntax

```
show ip fib stack-unit id vrf vrf-name [ip-address [mask]
[longer-prefixes] | summary]
```

## Parameters

|                               |                                                                                                                                                                                                               |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>id</i></b>              | Enter the S-Series stack unit ID. The unit ID range is from 0 to 11 for the S4820T.                                                                                                                           |
| <b><i>vrf vrf-name</i></b>    | Enter the keyword <code>vrf</code> followed by the name of the VRF to view FIB entries corresponding to that VRF.                                                                                             |
| <b><i>ip-address mask</i></b> | (OPTIONAL) Enter the IP address of the network destination to view only information on that destination. Enter the IP address in dotted decimal format (A.B.C.D). Enter the mask in slash prefix format (/X). |
| <b><i>longer-prefixes</i></b> | (OPTIONAL) Enter the keywords <code>longer-prefixes</code> to view all routes with a common prefix.                                                                                                           |
| <b><i>summary</i></b>         | (OPTIONAL) Enter the keyword <code>summary</code> to view the total number of prefixes in the FIB.                                                                                                            |

## Command Modes

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                  |
|----------|----------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                  |
| 9.4(0.0) | Added support for VRF.                       |
| 9.0.2.0  | Introduced on the S6000.                     |
| 8.3.19.0 | Introduced on the S4820T.                    |
| 8.3.11.1 | Introduced on the Z9000.                     |
| 8.3.7.0  | Introduced on the S4810.                     |
| 7.7.1.0  | Added support for up to seven stack members. |
| 7.6.1.0  | Introduced on the S-Series.                  |

## Usage Information

The following describes the `show ip fib stack-unit` command shown in the following example.

| Field              | Description                                                                                                                             |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Destination</b> | Lists the destination IP address.                                                                                                       |
| <b>Gateway</b>     | Displays either the word "direct" and an interface for a directly connected route or the remote IP address used to forward the traffic. |
| <b>First-Hop</b>   | Displays the first hop IP address.                                                                                                      |

| Field    | Description                                                       |
|----------|-------------------------------------------------------------------|
| Mac-Addr | Displays the MAC address.                                         |
| Port     | Displays the egress-port information.                             |
| VId      | Displays the VLAN ID. If no VLAN is assigned, zero (0) is listed. |
| EC       | Displays the number of ECMP paths.                                |

If weighted ECMP is enabled, then the `show ip fib stack-unit` command display a new column named W-EC (Weighted ECMP). This column displays either a value of `1` or `0` depending on whether or not a route is assigned with a weight.

### Example

```
Dell#show ip fib stack-unit 1
Destination Gateway          First-Hop Mac-
Addr         Port            VId    EC
-----
1.1.1.2/32   via 1.1.1.2, V1 1000 1.1.1.2

2.1.1.2/32   via 2.1.1.2, V1 20    2.1.1.2
00:03:00:00:00:02 Po 10      20    0
0.0.0.0/0    -          -      0    0
00:00:00:00:00:00 CP          0    0
1.1.1.0/24   Direct, V1 1000 0.0.0.0
00:00:00:00:00:00 CP          1000 0
1.1.1.1/32   via 127.0.0.1 127.0.0.1
00:00:00:00:00:00 CP          0    0
2.1.1.0/24   Direct, V1 20    0.0.0.0
00:00:00:00:00:00 CP          20    0
2.1.1.1/32   via 127.0.0.1 127.0.0.1
00:00:00:00:00:00 CP          0    0
100.1.1.0/24 via 1.1.1.2, V1 1000 1.1.1.2
00:01:00:00:00:02 Te 3/42    1000 1
100.1.1.0/24 via 2.1.1.2, V1 20    2.1.1.2
00:03:00:00:00:02 Po 10      20    1
Dell#

Dell#show ip route
S    10.1.1.0/24          via 1.1.1.2, V1 10
                               via 2.1.1.2, V1 20
S    20.1.1.0/24          via 3.1.1.2, V1 30
S    100.1.1.0/24         via 10.1.1.0, weight 7
                               via 20.1.1.0, weight 1
```

### Example (Show command output with Weighted ECMP Enabled)

```
Dell#show ip fib stack-unit 1
Destination Gateway          First-Hop Mac-
Addr         Port            VId    EC    RC W
-----
0.0.0.0/0    -          -      0    0    - -
00:00:00:00:00:00 CP          0    0    - -
1.1.1.0/24   Direct, Lo 0    0.0.0.0
00:00:00:00:00:00 CP          0    0    - -
1.1.1.1/32   via 127.0.0.1 127.0.0.1
00:00:00:00:00:00 CP          0    0    - -
```

The RC and W columns in the show output appear only if the weighted ECMP is enabled using the `ip ecmp weighted` command.

#### Related Commands

[clear ip fib stack-unit](#) — clear FIB entries on a specified stack-unit.

[ip ecmp weighted](#) — enables weighted ECMP calculations.

## show ip flow

Show how a Layer 3 packet is forwarded when it arrives at a particular interface.

### S4820T

#### Syntax

```
show ip flow interface interface {source-ip address
destination-ip address} {protocol number [tcp | udp]} {src-port
number destination-port number}
```

#### Parameters

|                                                  |                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>interface</b><br><i>interface</i>             | Enter the keyword <i>interface</i> then one of the following interface keywords. <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li></ul> |
| <b>source-ip</b><br><i>address</i>               | Enter the keywords <i>source-ip</i> then the IP source address in IP address format.                                                                                                                                                                                                                                                                                              |
| <b>destination-ip</b><br><i>address</i>          | Enter the keywords <i>destination-ip</i> then the IP destination address in IP address format.                                                                                                                                                                                                                                                                                    |
| <b>protocol</b><br><i>number</i> [tcp  <br>udp]  | Enter the keyword <i>protocol</i> then one of the protocol type keywords: <code>tcp</code> , <code>udp</code> , or <i>protocol number</i> . The protocol number range is from 0 to 255. .                                                                                                                                                                                         |
| <b>src-port</b><br><i>number</i>                 | Enter the keywords <i>src-port</i> then the source port number.                                                                                                                                                                                                                                                                                                                   |
| <b>destination-</b><br><b>port</b> <i>number</i> | Enter the keywords <i>destination-port</i> then the destination port number.                                                                                                                                                                                                                                                                                                      |

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                                          |
|-------------|------------------------------------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON.                          |
| 9.0.2.0     | Introduced on the S6000.                             |
| 8.3.19.0    | Introduced on the S4820T.                            |
| 8.3.11.1    | Introduced on the Z9000.                             |
| 8.3.10.0    | Introduced on the S4810.                             |
| 8.5.1.0     | Added support for 4-port 40G line cards on ExaScale. |
| 8.1.1.0     | Introduced on the E-Series ExaScale.                 |
| 7.9.1.0     | Introduced VRF on the E-Series.                      |
| 7.6.1.0     | Introduced on the S-Series.                          |
| 7.5.1.0     | Introduced on the C-Series.                          |
| pre-6.1.1.0 | Introduced on the E-Series.                          |

#### Usage Information

This command provides egress port information for a given IP flow. This information is useful in identifying which interface the packet follows in the case of Port-channel and Equal Cost Multi Paths. Use this command for routed packets only. For switched packets, use the `show port-channel-flow` command.

The `show ip flow` command does not compute the egress port information when `load-balance mac hashing` is also configured due to insufficient information (the egress MAC is not available).

S-Series produces the following error message: `%Error: Unable to read IP route table.`

#### Example

```
Dell#show ip flow interface te 2/42 20.1.1.1 100.1.1.2
protocol tcp
Flow: 20.1.1.1 100.1.1.2 6
Ingress interface: Te 2/42
Egress Interface: Te 2/43
Dell#
```

## show ip interface

View IP-related information on all interfaces.

### S4820T

**Syntax** `show ip interface [interface | brief] [configured]`

## Parameters

### *interface*

(OPTIONAL)

Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For the Management interface on the stack-unit, enter the keyword `ManagementEthernet` then the slot/port information. The slot range is from 0 to 1. The port range is 0.
- For a port channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a Null interface, enter the keyword `null` then the Null interface number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- For a stack-unit interface, enter the keyword `stack-unit` then the stack unit number.
- For a tunnel interface, enter the keyword `tunnel` then the tunnel interface number. The range is from 1 to 16383.

### *brief*

(OPTIONAL) Enter the keyword `brief` to view a brief summary of the interfaces and whether an IP address is assigned.

### *configured*

(OPTIONAL) Enter the keyword `configured` to display the physical interfaces with non-default configurations only.

## Command Modes

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |

| Version     | Description                                          |
|-------------|------------------------------------------------------|
| 8.5.1.0     | Added support for 4-port 40G line cards on ExaScale. |
| 8.3.7.0     | Introduced on the S4810.                             |
| 8.1.1.2     | Supported on the E-Series ExaScale E600i.            |
| 8.1.1.0     | Introduced on the E-Series ExaScale.                 |
| 7.6.1.0     | Introduced on the S-Series.                          |
| 7.5.1.0     | Introduced on the C-Series.                          |
| pre-6.1.1.0 | Introduced on the E-Series.                          |

### Usage Information

The following describes the `show ip interface` command shown in the following example.

| Lines                     | Description                                                                                                         |
|---------------------------|---------------------------------------------------------------------------------------------------------------------|
| TenGigabitEthernet 1/1... | Displays the interface's type, slot/port, and physical and line protocol status.                                    |
| Internet address...       | States whether an IP address is assigned to the interface. If an IP address is assigned, that address is displayed. |
| IP MTU is...              | Displays IP MTU value.                                                                                              |
| Inbound access...         | Displays the name of the configured incoming access list. If none is configured, the phrase "not set" is displayed. |
| Proxy ARP...              | States whether proxy ARP is enabled on the interface.                                                               |
| Split horizon...          | States whether split horizon for RIP is enabled on the interface.                                                   |
| Poison Reverse...         | States whether poison for RIP is enabled on the interface.                                                          |
| ICMP redirects...         | States if ICMP redirects are sent.                                                                                  |
| ICMP unreachable...       | States if ICMP unreachable messages are sent.                                                                       |

### Example

```
Dell#show ip int te 1/1
TenGigabitEthernet 1/1 is down, line protocol is down
Internet address is not set
IP MTU is 1500 bytes
Inbound access list is not set
Proxy ARP is enabled
Split Horizon is enabled
Poison Reverse is disabled
ICMP redirects are not sent
ICMP unreachables are not sent

Dell#
```

### Usage Information

The following describes the `show ip interface brief` command shown in the following example.

| Fields            | Description                                                                       |
|-------------------|-----------------------------------------------------------------------------------|
| <b>Interface</b>  | Displays type of interface and the associated slot and port number.               |
| <b>IP-Address</b> | Displays the IP address for the interface, if configured.                         |
| <b>Ok?</b>        | Indicates if the hardware is functioning properly.                                |
| <b>Method</b>     | Displays "Manual" if the configuration is read from the saved configuration.      |
| <b>Status</b>     | States whether the interface is enabled (up) or disabled (administratively down). |
| <b>Protocol</b>   | States whether IP is enabled (up) or disabled (down) on the interface.            |

#### Example (Brief)

```
Dell#show ip interface brief
Interface                IP-Address  OK?  Method
Status                    Protocol
TenGigabitEthernet 1/0  unassigned NO   Manual
administratively down down
TenGigabitEthernet 1/1  unassigned NO   Manual
administratively down down
TenGigabitEthernet 1/2  unassigned YES  Manual
up                          up
TenGigabitEthernet 1/3  unassigned YES  Manual
up                          up
TenGigabitEthernet 1/4  unassigned YES  Manual
up                          up
TenGigabitEthernet 1/5  10.10.10.1 YES  Manual
up                          up
TenGigabitEthernet 1/6  unassigned NO   Manual
administratively down down
```

## show ip management-route

View the IP addresses assigned to the Management interface.

### S4820T

#### Syntax

```
show ip management-route [all | connected | summary | static]
```

#### Parameters

|                  |                                                                                                                                         |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <b>all</b>       | (OPTIONAL) Enter the keyword <code>all</code> to view all IP addresses assigned to all Management interfaces on the switch.             |
| <b>connected</b> | (OPTIONAL) Enter the keyword <code>connected</code> to view only routes directly connected to the Management interface.                 |
| <b>summary</b>   | (OPTIONAL) Enter the keyword <code>summary</code> to view a table listing the number of active and non-active routes and their sources. |

**static** (OPTIONAL) Enter the keyword `static` to view non-active routes also.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                          |
|-------------|--------------------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON.          |
| 9.0.2.0     | Introduced on the S6000.             |
| 8.3.19.0    | Introduced on the S4820T.            |
| 8.3.11.1    | Introduced on the Z9000.             |
| 8.3.7.0     | Introduced on the S4810.             |
| 8.1.1.0     | Introduced on the E-Series ExaScale. |
| 7.5.1.0     | Introduced on the C-Series.          |
| pre-6.1.1.0 | Introduced on the E-Series.          |

**Example**

```
Dell#show ip management-route
Destination      Gateway          State
-----
10.1.2.0/24      ManagementEthernet 0/0  Connected
172.16.1.0/24    10.1.2.4        Active
Dell#
```

## show ipv6 management-route

Display the IPv6 static routes configured for the management interface.

### S4820T

**Syntax**

```
show ipv6 management-route [all | connected | summary | static]
```

**Parameters**

- all** (OPTIONAL) Enter the keyword `all` to view all IP addresses assigned to all Management interfaces on the switch.
- connected** (OPTIONAL) Enter the keyword `connected` to view only routes directly connected to the Management interface.

**summary** (OPTIONAL) Enter the keyword `summary` to view a table listing the number of active and non-active routes and their sources.

**static** (OPTIONAL) Enter the keyword `static` to view non-active routes also.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                        |
|----------|------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.        |
| 9.0.2.0  | Introduced on the S6000.           |
| 9.0.0.0  | Introduced on the Z9000.           |
| 8.3.19.0 | Introduced on the S4820T.          |
| 8.4.1.0  | Introduced on the C- and E-Series. |
| 8.3.7.0  | Introduced on the S4810.           |

**Example**

```
Dell#show ipv6 management-route
IPv6 Destination      Gateway                State
-----
2001:34::0/64         ManagementEthernet 0/0 Connected
2001:68::0/64         2001:34::16          Active
Dell#
```

## show ip protocols

View information on all routing protocols enabled and active on the switch.

### S4820T

**Syntax**

`show ip protocols`

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                                                               |
|-------------|---------------------------------------------------------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON.                                               |
| 9.0.2.0     | Introduced on the S6000.                                                  |
| 8.3.19.0    | Introduced on the S4820T.                                                 |
| 8.3.11.1    | Introduced on the Z9000.                                                  |
| 8.3.7.0     | Introduced on the S4810.                                                  |
| 8.1.1.0     | Introduced on the E-Series ExaScale.                                      |
| 7.6.1.0     | Regular evaluation optimization enabled/disabled added to display output. |
| 7.6.1.0     | Introduced on the S-Series.                                               |
| 7.5.1.0     | Introduced on the C-Series.                                               |
| pre-6.1.1.0 | Introduced on the E-Series.                                               |

#### Example

```
Dell#show ip protocols
Routing Protocol is "bgp 1"
  Cluster Id is set to 20.20.20.3
  Router Id is set to 20.20.20.3
  Fast-external-fallover enabled
  Regular expression evaluation optimization enabled
  Capable of ROUTE_REFRESH
  For Address Family IPv4 Unicast
    BGP table version is 0, main routing table version 0
    Distance: external 20 internal 200 local 200
  Neighbor(s):
    Address : 20.20.20.2
    Filter-list in : foo
    Route-map in : foo
    Weight : 0
    Address : 5::6
    Weight : 0
Dell#
```

## show ip route

View information, including how they were learned, about the IP routes on the switch.

### S4820T

#### Syntax

```
show ip route [vrf vrf-name] hostname | ip-address [mask]
[longer-prefixes] | list prefix-list | protocol [process-id |
routing-tag] | all | connected | static | summary]
```

## Parameters

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf vrf-name</b>     | (OPTIONAL) Enter the keyword <code>vrf</code> and then the VRF name to list the routes in the route table of a specific VRF.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>ip-address</b>       | (OPTIONAL) Specify a name of a device or the IP address of the device to view more detailed information about the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>mask</b>             | (OPTIONAL) Specify the network mask of the route. Use this parameter with the IP address parameter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>longer-prefixes</b>  | (OPTIONAL) Enter the keywords <code>longer-prefixes</code> to view all routes with a common prefix.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>list prefix-list</b> | (OPTIONAL) Enter the keyword <code>list</code> and the name of a configured prefix list. For more information, refer to the <a href="#">show ip route list</a> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>protocol</b>         | (OPTIONAL) Enter the name of a routing protocol ( <code>bgp</code> , <code>isis</code> , <code>ospf</code> , <code>rip</code> ) or the keywords <code>connected</code> or <code>static</code> .<br> <b>NOTE:</b> <code>bgp</code> , <code>isis</code> , <code>ospf</code> , and <code>rip</code> . <ul style="list-style-type: none"><li>• If you enter <code>bgp</code>, you can include the BGP <code>as-number</code>.</li><li>• If you enter <code>isis</code>, you can include the ISIS <code>routing-tag</code>.</li><li>• If you enter <code>ospf</code>, you can include the OSPF <code>process-id</code>.</li></ul> |
| <b>process-id</b>       | (OPTIONAL) Specify that only OSPF routes with a certain process ID must be displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>routing-tag</b>      | (OPTIONAL) Specify that only ISIS routes with a certain routing tag must be displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>connected</b>        | (OPTIONAL) Enter the keyword <code>connected</code> to view only the directly connected routes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>all</b>              | (OPTIONAL) Enter the keyword <code>all</code> to view both active and non-active routes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>static</b>           | (OPTIONAL) Enter the keyword <code>static</code> to view only routes the <code>ip route</code> command configures.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>summary</b>          | (OPTIONAL) Enter the keyword <code>summary</code> . For more information, refer to the <a href="#">show ip route summary</a> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                          |
|-------------|--------------------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON.          |
| 9.4.(0.0)   | Added support for VRF.               |
| 9.0.2.0     | Introduced on the S6000.             |
| 8.3.19.0    | Introduced on the S4820T.            |
| 8.3.11.1    | Introduced on the Z9000.             |
| 8.3.7.0     | Introduced on the S4810.             |
| 8.1.1.0     | Introduced on the E-Series ExaScale. |
| 7.9.1.0     | Introduced VRF on the E-Series.      |
| 7.6.1.0     | Introduced on the S-Series.          |
| 7.5.1.0     | Introduced on the C-Series.          |
| pre-6.1.1.0 | Introduced on the E-Series.          |

### Usage Information

The following describes the `show ip route all` command in the following example.

| Field       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| (undefined) | Identifies the type of route: <ul style="list-style-type: none"> <li>• C = connected</li> <li>• S = static</li> <li>• R = RIP</li> <li>• B = BGP</li> <li>• IN = internal BGP</li> <li>• EX = external BGP</li> <li>• LO = Locally Originated</li> <li>• O = OSPF</li> <li>• IA = OSPF inter area</li> <li>• N1 = OSPF NSSA external type 1</li> <li>• N2 = OSPF NSSA external type 2</li> <li>• E1 = OSPF external type 1</li> <li>• E2 = OSPF external type 2</li> <li>• i = IS-IS</li> <li>• L1 = IS-IS level-1</li> <li>• L2 = IS-IS level-2</li> <li>• IA = IS-IS inter-area</li> <li>• * = candidate default</li> <li>• &gt; = non-active route</li> <li>• + = summary routes</li> </ul> |
| Destination | Identifies the route's destination IP address                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Field       | Description                                                                                        |
|-------------|----------------------------------------------------------------------------------------------------|
| Gateway     | Identifies whether the route is directly connected and on which interface the route is configured. |
| Dist/Metric | Identifies if the route has a specified distance or metric.                                        |
| Last Change | Identifies when the route was last changed or configured.                                          |

The weight for weighted ECMP route calculations is displayed for each path in the route in `show ip route` command. The ECMP weight is displayed only if weighted ECMP is enabled using the `ip ecmp weighted` command is enabled.

If weighted ECMP is disabled, the `show ip route` command does not show the weighted ECMP route information.

### Example

```
Dell#show ip route all

Codes:C- connected, S - static, R - RIP
      B- BGP, IN - internal BGP, EX - external BGP, LO -
Locally Originated
      O- OSPF, IA - OSPF inter area N1 - OSPF NSSA external
type 1
      N2- OSPF NSSA external type 2, E1 - OSPF external type 1
      E2- OSPF external type 2, i - IS-IS, L1 - IS-IS level-1
      L2- IS-IS level-2, IA - IS-IS inter area, * - candidate
default
      >- non-active route + - summary route

Gateway of last resort is not set

      Destination      Gateway                Dist/Metric Last Change
-----
R    3.0.0.0/8         via 100.10.10.10, Te 2/8 120/1    00:07:12
                        via 101.10.10.10, Te 2/9
                        Direct, Te 2/8          0/0      00:08:54

## show ip route list

Display IP routes in an IP prefix list.

### S4820T

**Syntax**

```
show ip route vrf vrf-name list prefix-list
```

**Parameters**

***prefix-list***

Enter the name of a configured prefix list.

***vrf vrf-name***

Enter the keyword `vrf` followed by the name of the VRF to display IP routes in an IP prefix list corresponding to that VRF.

## Command Modes

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                          |
|-------------|--------------------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON.          |
| 9.4(0.0)    | Added support for VRF.               |
| 9.0.2.0     | Introduced on the S6000.             |
| 8.3.19.0    | Introduced on the S4820T.            |
| 8.3.11.1    | Introduced on the Z9000.             |
| 8.3.7.0     | Introduced on the S4810.             |
| 8.1.1.0     | Introduced on the E-Series ExaScale. |
| 7.6.1.0     | Introduced on the S-Series.          |
| 7.5.1.0     | Introduced on the C-Series.          |
| pre-6.1.1.0 | Introduced on the E-Series.          |

## Example

```
Dell#show ip route list test

Codes:C- connected, S - static, R - RIP,
      B- BGP, IN - internal BGP, EX - external BGP, LO -
Locally Originated,
      O- OSPF, IA - OSPF inter area, N1 - OSPF NSSA external
type 1,
      N2- OSPF NSSA external type 2, E1 - OSPF external type 1,
      E2- OSPF external type 2, i - IS-IS, L1 - IS-IS level-1,
      L2- IS-IS level-2, IA - IS-IS inter area, * - candidate
default,
      >- non-active route, + - summary route
```

## Related Commands

[ip prefix-list](#) — enters CONFIGURATION-IP PREFIX-LIST mode and configures a prefix list.

[show ip prefix-list summary](#) — displays a summary of the configured prefix lists.

# show ip route summary

View a table summarizing the IP routes in the switch.

## S4820T

**Syntax** `show ip route vrf vrf-name summary`

**Parameters** `vrf vrf-name` Enter the keyword `vrf` followed by the name of the VRF to view information on the IP routes corresponding to that VRF.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                          |
|-------------|--------------------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON.          |
| 9.4(0.0)    | Added support for VRF.               |
| 9.0.2.0     | Introduced on the S6000.             |
| 8.3.19.0    | Introduced on the S4820T.            |
| 8.3.11.1    | Introduced on the Z9000.             |
| 8.3.7.0     | Introduced on the S4810.             |
| 8.1.1.0     | Introduced on the E-Series ExaScale. |
| 7.6.1.0     | Introduced on the S-Series.          |
| 7.5.1.0     | Introduced on the C-Series.          |
| pre-6.1.1.0 | Introduced on the E-Series.          |

**Usage Information** The following describes the `show ip route summary` shown in the following example.

| Column Heading | Description                                                                |
|----------------|----------------------------------------------------------------------------|
| Route Source   | Identifies how the route is configured in Dell Networking OS.              |
| Active Routes  | Identifies the best route if a route is learned from two protocol sources. |

| Column Heading              | Description                                                                                                                                                                       |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Non-active Routes</b>    | Identifies the back-up routes when a route is learned by two different protocols. If the best route or active route goes down, the non-active route becomes the best route.       |
| <b>ospf 100</b>             | If routing protocols (OSPF, RIP) are configured and routes are advertised, then information on those routes is displayed.                                                         |
| <b>Total 1388 active...</b> | Displays the number of active and non-active routes and the memory usage of those routes. If there are no routes configured in the Dell Networking OS, this line does not appear. |

### Example

```
Dell>show ip route summary

Route Source   Active Routes   Non-active Routes
connected      17              0
static         3               0
ospf 100       1368           2
Intra-area: 762 Inter-area: 1 External-1: 600 External-2: 5
Total         1388           2
Total 1388 active route(s) using 222440 bytes
Total 2 non-active route(s) using 128 bytes
Dell>
```

### Related Commands

[show ip route](#) — displays information about the routes found in the switch.

## show ip traffic

View IP, ICMP, UDP, TCP and ARP traffic statistics.

### S4820T

#### Syntax

```
show ip traffic [all | cp | rp1 | rp2]
```

**NOTE:** These options are supported only on the E-Series.

#### Parameters

|            |                                                                                                                                                                        |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>all</b> | (OPTIONAL) Enter the keyword <code>all</code> to view statistics from all processors. If you do not enter a keyword, you also view all statistics from all processors. |
| <b>cp</b>  | (OPTIONAL) Enter the keyword <code>cp</code> to view only statistics from the Control Processor.                                                                       |
| <b>rp1</b> | (OPTIONAL) Enter the keyword <code>rp1</code> to view only the statistics from Route Processor 1.                                                                      |

**rp2** (OPTIONAL) Enter the keyword `rp2` to view only the statistics from Route Processor 2.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                                                                      |
|-------------|----------------------------------------------------------------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON.                                                      |
| 9.0.2.0     | Introduced on the S6000.                                                         |
| 8.3.19.0    | Introduced on the S4820T.                                                        |
| 8.3.11.1    | Introduced on the Z9000.                                                         |
| 8.3.7.0     | Introduced on the S4810.                                                         |
| 8.1.1.0     | Introduced on the E-Series ExaScale.                                             |
| 7.6.1.0     | Introduced on the S-Series.                                                      |
| 7.5.1.0     | Introduced on the C-Series.                                                      |
| 6.5.1.0     | F10 Monitoring MIB available for the <code>ip traffic statistics</code> command. |
| pre-6.1.1.0 | Introduced on the E-Series.                                                      |

**Usage Information**

The following describes the `show ip traffic` summary shown in the following example.

| Keyword                     | Definition                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>unknown protocol...</b>  | No receiver for these packets. Counts packets whose protocol type field is not recognized by Dell Networking OS.                                                                                                                                                                                                                                        |
| <b>not a gateway...</b>     | Packets can not be routed; the host/network is unreachable.                                                                                                                                                                                                                                                                                             |
| <b>security failures...</b> | Counts the number of received unicast/multicast packets that could not be forwarded due to: <ul style="list-style-type: none"><li>• route not found for unicast/multicast; ingress interfaces do not belong to the destination multicast group</li><li>• destination IP address belongs to reserved prefixes; the host/network is unreachable</li></ul> |
| <b>bad options...</b>       | Unrecognized IP option on a received packet.                                                                                                                                                                                                                                                                                                            |
| <b>Frag:</b>                | IP fragments received.                                                                                                                                                                                                                                                                                                                                  |
| <b>... reassembled</b>      | Number of IP fragments that were reassembled.                                                                                                                                                                                                                                                                                                           |

| Keyword                 | Definition                                                                                                                                                                                                                                                                              |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ... timeouts            | Number of times a timer expired on a reassembled queue.                                                                                                                                                                                                                                 |
| ... too big             | Number of invalid IP fragments received.                                                                                                                                                                                                                                                |
| ... couldn't fragment   | Number of packets that could not be fragmented and forwarded.                                                                                                                                                                                                                           |
| ...encapsulation failed | Counts packets which could not be forwarded due to ARP resolution failure. Dell Networking OS sends an arp request prior to forwarding an IP packet. If a reply is not received, Dell Networking OS repeats the request three times. These packets are counted in encapsulation failed. |
| <b>Rcvd:</b>            |                                                                                                                                                                                                                                                                                         |
| ...short packets        | The number of bytes in the packet are too small.                                                                                                                                                                                                                                        |
| ...bad length           | The length of the packet was not correct.                                                                                                                                                                                                                                               |
| ...no port broadcasts   | The incoming broadcast/multicast packet did not have any listener.                                                                                                                                                                                                                      |
| ...socket full          | The applications buffer is full and the incoming packet are dropped.                                                                                                                                                                                                                    |

The Dell Monitoring MIB provides access to the following statistics.

- **IP Statistics: Bcast: Received:** Object = f10BcastPktRecv, OIDs = 1.3.6.1.4.1.6027.3.3.5.1.1
- **IP Statistics: Bcast: Sent:** Object = f10BcastPktSent, OIDs = 1.3.6.1.4.1.6027.3.3.5.1.2
- **IP Statistics: Mcast: Received:** Object = f10McastPktRecv, OIDs = 1.3.6.1.4.1.6027.3.3.5.1.3
- **IP Statistics: Mcast: Sent:** Object = f10McastPktSent, OIDs = 1.3.6.1.4.1.6027.3.3.5.1.4
- **ARP Statistics: Rcvd: Request:** Object = f10ArpReqRecv, OIDs = 1.3.6.1.4.1.6027.3.3.5.2.1
- **ARP Statistics: Rcvd: Replies:** Object = f10ArpReplyRecv, OIDs = 1.3.6.1.4.1.6027.3.3.5.2.3
- **ARP Statistics: Sent: Request:** Object = f10ArpReqSent, OIDs = 1.3.6.1.4.1.6027.3.3.5.2.2
- **ARP Statistics: Sent: Replies:** Object = f10ArpReplySent, OIDs = 1.3.6.1.4.1.6027.3.3.5.2.4
- **ARP Statistics: Sent: Proxy:** Object = f10ArpProxySent, OIDs = 1.3.6.1.4.1.6027.3.3.5.2.5

### Example

```
Dell#show ip traffic
Control Processor IP Traffic:
```

```
IP statistics:
  Rcvd: 23857 total, 23829 local destination
        0 format errors, 0 checksum errors, 0 bad hop count
        0 unknown protocol, 0 not a gateway
        0 security failures, 0 bad options
  Frags: 0 reassembled, 0 timeouts, 0 too big
        0 fragmented, 0 couldn't fragment
```

```

    Bcast: 28 received, 0 sent; Mcast: 0 received, 0 sent
    Sent: 16048 generated, 0 forwarded
        21 encapsulation failed, 0 no route
ICMP statistics:
    Rcvd: 0 format errors, 0 checksum errors, 0 redirects, 0
unreachable
        0 echo, 0 echo reply, 0 mask requests, 0 mask replies, 0
quench
        0 parameter, 0 timestamp, 0 info request, 0 other
    Sent: 0 redirects, 0 unreachable, 0 echo, 0 echo reply
        0 mask requests, 0 mask replies, 0 quench, 0 timestamp
        0 info reply, 0 time exceeded, 0 parameter problem
UDP statistics:
    Rcvd: 0 total, 0 checksum errors, 0 no port
        0 short packets, 0 bad length, 0 no port broadcasts, 0
socket full
    Sent: 0 total, 0 forwarded broadcasts
TCP statistics:
    Rcvd: 23829 total, 0 checksum errors, 0 no port
    Sent: 16048 total
ARP statistics:
    Rcvd: 156 requests, 11 replies
    Sent: 21 requests, 10 replies (0 proxy)
Routing Processor1 IP Traffic:

```

## show tcp statistics

View information on TCP traffic through the switch.

### S4820T

|                        |                                                                                                                                                                |                                                                                            |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>show tcp statistics {all   cp   rp1   rp2}</code>                                                                                                        |                                                                                            |
| <b>Parameters</b>      | <b>all</b>                                                                                                                                                     | Enter the keyword <code>all</code> to view all TCP information.                            |
|                        | <b>cp</b>                                                                                                                                                      | Enter the keyword <code>cp</code> to view only TCP information from the Control Processor. |
|                        | <b>rp1</b>                                                                                                                                                     | Enter the keyword <code>rp1</code> to view only TCP statistics from Route Processor 1.     |
|                        | <b>rp2</b>                                                                                                                                                     | Enter the keyword <code>rp2</code> to view only TCP statistics from Route Processor 2.     |
| <b>Command Modes</b>   | EXEC Privilege                                                                                                                                                 |                                                                                            |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |                                                                                            |
|                        | The following is a list of the Dell Networking OS version history for this command.                                                                            |                                                                                            |

|          |                                      |
|----------|--------------------------------------|
| 9.0.2.0  | Introduced on the S6000.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.3.7.0  | Introduced on the S4810.             |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 6.4.1.0  | Introduced                           |

## Usage Information

The following describes the `show tcp statistics cp` command shown in the following example.

| Field                            | Description                                                                                                                                                                                                                 |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rcvd:                            | Displays the number and types of TCP packets received by the switch. <ul style="list-style-type: none"> <li>Total = total packets received</li> <li>no port = number of packets received with no designated port</li> </ul> |
| 0 checksum error...              | Displays the number of packets received with the following: <ul style="list-style-type: none"> <li>checksum errors</li> <li>bad offset to data</li> <li>too short</li> </ul>                                                |
| 329 packets...                   | Displays the number of packets and bytes received in sequence.                                                                                                                                                              |
| 17 dup...                        | Displays the number of duplicate packets and bytes received.                                                                                                                                                                |
| 0 partially...                   | Displays the number of partially duplicated packets and bytes received.                                                                                                                                                     |
| 7 out-of-order...                | Displays the number of packets and bytes received out of order.                                                                                                                                                             |
| 0 packets with data after window | Displays the number of packets and bytes received that exceed the switch's window size.                                                                                                                                     |
| 0 packets after close            | Displays the number of packet received after the TCP connection was closed.                                                                                                                                                 |
| 0 window probe packets...        | Displays the number of window probe and update packets received.                                                                                                                                                            |
| 41 dup ack...                    | Displays the number of duplicate acknowledgement packets and acknowledgement packets with data received.                                                                                                                    |
| 10184 ack...                     | Displays the number of acknowledgement packets and bytes received.                                                                                                                                                          |

| Field                         | Description                                                                                                                                   |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| Sent:                         | Displays the total number of TCP packets sent and the number of urgent packets sent.                                                          |
| 25 control packets...         | Displays the number of control packets sent and the number retransmitted.                                                                     |
| 11603 data packets...         | Displays the number of data packets sent.                                                                                                     |
| 24 data packets retransmitted | Displays the number of data packets resent.                                                                                                   |
| 355 ack..                     | Displays the number of acknowledgement packets sent and the number of packet delayed.                                                         |
| 0 window probe...             | Displays the number of window probe and update packets sent.                                                                                  |
| 7 Connections initiated...    | Displays the number of TCP connections initiated, accepted, and established.                                                                  |
| 14 Connections closed...      | Displays the number of TCP connections closed, dropped.                                                                                       |
| 20 Total rxmt...              | Displays the number of times the switch tried to re-send data and the number of connections dropped during the TCP retransmit timeout period. |
| 0 Keepalive....               | Lists the number of keepalive packets in timeout, the number keepalive probes and the number of TCP connections dropped during keepalive.     |

### Example

```
Dell#show tcp stat cp

Control Processor TCP:
Rcvd: 10585 Total, 0 no port
    0 checksum error, 0 bad offset, 0 too short
    329 packets (1263 bytes) in sequence
    17 dup packets (6 bytes)
    0 partially dup packets (0 bytes)
    7 out-of-order packets (0 bytes)
    0 packets ( 0 bytes) with data after window
    0 packets after close
    0 window probe packets, 41 window update packets
    41 dup ack packets, 0 ack packets with unsend data
    10184 ack packets (12439508 bytes)
Sent: 12007 Total, 0 urgent packets
    25 control packets (including 24 retransmitted)
    11603 data packets (12439677 bytes)
    24 data packets (7638 bytes) retransmitted
    355 ack only packets (41 delayed)
    0 window probe packets, 0 window update packets
    7 Connections initiated, 8 connections accepted, 15
connections established
    14 Connections closed (including 0 dropped, 0 embryonic
dropped)
    20 Total rxmt timeout, 0 connections dropped in rxmt timeout
    0 Keepalive timeout, 0 keepalive probe, 0 Connections
```

dropped in keepalive

**Related  
Commands**

[show ip cam stack-unit](#) – displays the CAM table.

# IPv6 Access Control Lists (IPv6 ACLs)

IPv6 ACLs and IPv6 Route Map commands are supported on Dell Networking S4820T platform.

 **NOTE:** For IPv4 ACL commands, refer to the [Access Control Lists \(ACL\)](#) chapter.

## Important Points to Remember

- Certain platforms require manual CAM usage space allotment. For more information, refer to the [cam-acl](#) command.
- Egress IPv6 ACL and IPv6 ACL on the Loopback interface is not supported.
- Reference to an empty ACL permits any traffic.
- ACLs are not applied to self-originated traffic (for example, Control Protocol traffic not affected by IPv6 ACL because the routed bit is not set for Control Protocol traffic and for egress ACLs the routed bit must be set).
- You can use the same access list name for both IPv4 and IPv6 ACLs.
- You can apply both IPv4 and IPv6 ACLs on an interface at the same time.
- You can apply IPv6 ACLs on physical interfaces and a logical interfaces (Port-channel/VLAN).
- Non-contiguous masks are not supported in source or destination addresses in IPv6 ACL entries.
- Because the prefix mask is specified in /x format in IPv6 ACLs, inverse mask is not supported.

## show cam-acl-egress

Show information on FP groups allocated for egress ACLs.

### S4820T

**Syntax** `show cam-acl-egress`

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                           |
|----------|---------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.           |
| 9.0.2.0  | Introduced on the S6000.              |
| 8.3.19.0 | Introduced on the S4820T.             |
| 8.3.7.0  | Introduced on the S4810.              |
| 8.4.2.1  | Introduced on the S-Series.           |
| 8.4.2.0  | Introduced on the E-Series TeraScale. |
| 7.8.1.0  | Introduced on the C-Series.           |

### Example

```
Dell#show cam-acl-egress

-- Chassis Egress Cam ACL --
      Current Settings(in block sizes)
L2Acl   :           1
Ipv4Acl :           1
Ipv6Acl :           2

-- Stack unit 0 --
      Current Settings(in block sizes)
L2Acl   :           1
Ipv4Acl :           1
Ipv6Acl :           2

Dell#show cam-acl
```

### Related Commands

[cam-acl](#) — configures CAM profiles to support IPv6 ACLs.

## show cam-acl

Show space allocated for IPv6 ACLs.

Ipv4Qos :      2
L2Qos   :      3

Dell#show cam-acl
```

**Related  
Commands**

[cam-acl](#) – configures CAM profiles to support IPv6 ACLs.

## permit icmp

To allow all or specific internet control message protocol (ICMP) messages, configure a filter.

### S4820T

**Syntax**

```
permit icmp {source address mask | any | host ipv6-address}
{destination address | any | host ipv6-address} [message-type]
[count [byte]] | [log] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit icmp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command.

**Parameters**

**Defaults** Not configured.

**Command Modes** ACCESS-LIST

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                  |
|----------|------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                  |
| 9.0.2.0  | Introduced on the S6000.                                                     |
| 8.3.19.0 | Introduced on the S4820T.                                                    |
| 8.3.7.0  | Introduced on the S4810.                                                     |
| 8.4.2.1  | Introduced on the S-Series.                                                  |
| 8.2.1.0  | Introduced on the E-Series ExaScale.                                         |
| 7.8.1.0  | Introduced on the C-Series.                                                  |
| 7.4.1.0  | Introduced on the E-Series TeraScale. Added the <code>monitor</code> option. |

## permit

To configure a filter that matches the filter criteria, select an IPv6 protocol number, ICMP, IPv6, TCP, or UDP.

### Syntax

```
permit {ipv6-protocol-number | icmp | ipv6 | tcp | udp}
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command syntax if you know the filter's sequence number
- Use the `no permit {ipv6-protocol-number | icmp | ipv6 | tcp | udp}` command

### Parameters

|                           |                                                                                            |
|---------------------------|--------------------------------------------------------------------------------------------|
| <i>ip-protocol-number</i> | Enter an IPv6 protocol number. The range is from 0 to 255.                                 |
| <code>icmp</code>         | Enter the keyword <code>icmp</code> to filter internet Control Message Protocol version 6. |
| <code>ipv6</code>         | Enter the keyword <code>ipv6</code> to filter any internet Protocol version 6.             |
| <code>tcp</code>          | Enter the keyword <code>tcp</code> to filter the Transmission Control protocol.            |
| <code>udp</code>          | Enter the keyword <code>udp</code> to filter the User Datagram Protocol.                   |

### Defaults

Not configured.

### Command Modes

ACCESS-LIST

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.7.0  | Introduced on the S4810.    |

## ipv6 control-plane egress-filter

Enable egress Layer 3 ACL lookup for IPv6 CPU traffic.

### S4820T

**Syntax**

`ipv6 control-plane egress-filter`

**Defaults**

Not enabled.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 9.0.0.0  | Introduced on the Z9000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.10.0 | Introduced on the S4810.    |

# ipv6 access-list

Configure an access list based on IPv6 addresses or protocols.

## S4820T

**Syntax** `ipv6 access-list access-list-name cpu-qos {permit | deny} ospfv3`  
To delete an access list, use the `no ipv6 access-list access-list-name` command.

|                   |                         |                                                                                                        |
|-------------------|-------------------------|--------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>access-list-name</b> | Enter the access list name as a string, up to 140 characters.                                          |
|                   | <b>cpu-qos</b>          | Enter the keyword <code>cpu-qos</code> to assign this ACL to control plane traffic only (CoPP).        |
|                   | <b>permit</b>           | Enter the keyword <code>permit</code> to configure a filter to forward packets meeting this condition. |
|                   | <b>deny</b>             | Enter the keyword <code>deny</code> to configure a filter to drop packets meeting this condition.      |
|                   | <b>ospfv3</b>           | Specify that this ACL is for OSPFv3 control plane traffic                                              |

**Defaults** All access lists contain an implicit "deny any"; that is, if no match occurs, the packet is dropped.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                         |
|----------|-------------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                         |
| 9.4(0.0) | Added support for CoPP for OSPFv3 on the S4810, S4820T, S6000, and Z9000 platforms. |
| 9.0.2.0  | Introduced on the S6000                                                             |
| 8.3.11.1 | Introduced on the Z9000.                                                            |
| 8.3.19.0 | Introduced on the S4820T.                                                           |
| 8.3.7.0  | Introduced on the S4810.                                                            |
| 8.4.2.1  | Introduced on the S-Series.                                                         |
| 8.2.1.0  | Introduced on the E-Series ExaScale.                                                |

| Version | Description                                                                                                                                         |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| 7.8.1.0 | Introduced on the C-Series. Increased the name string to accept up to 140 characters. Prior to version 7.8.1.0, names are up to 16 characters long. |
| 7.4.1.0 | Introduced on the E-Series TeraScale.                                                                                                               |

**Usage Information**

The number of entries allowed per ACL is hardware-dependent. For detailed specification on entries allowed per ACL, refer to your line card documentation. You can create an IPv6 ACL for control-plane traffic policing for OSPFv3, in addition to the CoPP support for VRRP, BGP, and ICMP.

## cam-acl-egress

Allocate space for IPv6 egress ACLs.

### S4820T

**Syntax**

```
cam-acl-egress {default | l2acl 1-4 ipv4acl 1-4 ipv6acl 0-4}
```

**Parameters**

|                                                   |                                                                                                                                                                                                                                      |
|---------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>default</b>                                    | Use the default CAM profile settings, and set the CAM as follows: <ul style="list-style-type: none"> <li>L2 ACL(l2acl): <b>1</b></li> <li>L3 ACL (ipv4acl): <b>1</b></li> <li>IPv6 L3 ACL (ipv6acl): <b>2</b></li> </ul>             |
| <b>l2acl 1-4<br/>ipv4acl 1- 4<br/>ipv6acl 0-4</b> | Allocate space to support IPv6 ACLs. Enter all of the profiles and a range. Enter the CAM profile name then the amount to be allotted. The total space allocated must equal 4. The <code>ipv6acl</code> range must be a factor of 2. |

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |

| Version  | Description                           |
|----------|---------------------------------------|
| 8.3.11.1 | Introduced on the Z9000.              |
| 8.3.7.0  | Introduced on the S4810.              |
| 8.4.2.0  | Introduced on the E-Series TeraScale. |
| 8.2.1.0  | Introduced on the S-Series.           |
| 7.8.1.0  | Introduced on the C-Series.           |

### Usage Information

For the new settings to take effect, save the new CAM settings to the startup-config (`write-mem` or `copy run start`), then reload the system.

The total amount of space allowed is 4 FP Blocks.

### Example

```
Dell#
Dell#configure
Dell(conf)#cam-acl-egress ?
default      Reset Egress CAM ACL entries to default setting
l2acl        Set L2-ACL entries
Dell(conf)#cam-acl-egress l2acl ?
<1-4>        Number of FP blocks for l2acl
Dell(conf)#cam-acl-egress l2acl 1 ?
ipv4acl      Set IPV4-ACL entries
Dell(conf)#cam-acl-egress l2acl 1 ipv4acl 1 ?
ipv6acl      Set IPV6-ACL entries
Dell(conf)#cam-acl-egress l2acl 1 ipv4acl 1 ipv6acl ?
<0-4>        Number of FP blocks for IPV6 (multiples of 2)
Dell(conf)#cam-acl-egress l2acl 1 ipv4acl 1 ipv6acl 2
```

## cam-acl

Allocate space for IPv6 ACLs.

### S4820T

#### Syntax

```
cam-acl {default | l2acl 1-10 ipv4acl 1-10 ipv6acl 0-10 ipv4qos
1-10 l2qos 1-10}
```

#### Parameters

##### default

Use the default CAM profile settings, and set the CAM as follows:

- L3 ACL (ipv4acl): **6**
- L2 ACL(l2acl): **5**
- IPv6 L3 ACL (ipv6acl): **0**
- L3 QoS (ipv4qos): **1**
- L2 QoS (l2qos): **1**

**l2acl 1-10**  
**ipv4acl 1-10**  
**ipv6acl 0-10**  
**ipv4qos 1-10**  
**l2qos 1-10**

Allocate space to support IPv6 ACLs. Enter all of the profiles and a range. Enter the CAM profile name then the amount to be allotted. The total space allocated must equal 13. The `ipv6acl` range must be a factor of 2.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                           |
|----------|---------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.           |
| 9.0.2.0  | Introduced on the S6000.              |
| 8.3.19.0 | Introduced on the S4820T.             |
| 8.3.11.1 | Introduced on the Z9000.              |
| 8.3.7.0  | Introduced on the S4810.              |
| 8.4.2.0  | Introduced on the E-Series TeraScale. |
| 8.2.1.0  | Introduced on the S-Series.           |
| 7.8.1.0  | Introduced on the C-Series.           |

**Usage Information**

For the new settings to take effect, save the new CAM settings to the startup-config (`write-mem` or `copy run start`), then reload the system.

The total amount of space allowed is 16 FP blocks. System flow requires three blocks and these blocks cannot be reallocated.

When configuring space for IPv6 ACLs, the total number of Blocks must equal 13.

Ranges for the CAM profiles are from 1 to 10, except for the `ipv6acl` profile which is from 0 to 10. The `ipv6acl` allocation must be a factor of 2 (2, 4, 6, 8, 10).

## IPv6 Basics

IPv6 basic commands are supported on the Dell Networking OS.

 **NOTE:** For information about the Dell Networking operating software version and platform that supports IPv6 in each software feature, refer to the *IPv6 Addressing* chapter of the *Dell Networking OS Configuration Guide*.

### clear ipv6 fib

Clear (refresh) all forwarding information base (FIB) entries on a linecard or stack unit.

#### S4820T

| <b>Syntax</b>          | <code>clear ipv6 fib [vrf vrf-name] linecard slot   stack-unit unit-number</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |         |             |          |                        |         |                          |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------|----------|------------------------|---------|--------------------------|
| <b>Parameters</b>      | <p><b>vrf vrf-name</b> (Optional) Enter the keyword vrf followed by the name of the VRF to clear the neighbor corresponding to that VRF.</p> <p> <b>NOTE:</b> If you do not specify this option, neighbors corresponding to the default VRF are cleared.</p> <p><b>slot</b> Enter the slot number to clear the FIB for a linecard.</p> <p><b>unit-number</b> Enter the stack member number.<br/>The range is from 0 to 11 for the S4820T.</p>                              |         |             |          |                        |         |                          |
| <b>Command Modes</b>   | EXEC Privilege                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |         |             |          |                        |         |                          |
| <b>Command History</b> | <p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> <table border="0"> <thead> <tr> <th style="text-align: left;">Version</th> <th style="text-align: left;">Description</th> </tr> </thead> <tbody> <tr> <td>9.7(0.0)</td> <td>Added support for VRF.</td> </tr> <tr> <td>9.0.0.0</td> <td>Introduced on the Z9000.</td> </tr> </tbody> </table> | Version | Description | 9.7(0.0) | Added support for VRF. | 9.0.0.0 | Introduced on the Z9000. |
| Version                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |         |             |          |                        |         |                          |
| 9.7(0.0)               | Added support for VRF.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |         |             |          |                        |         |                          |
| 9.0.0.0                | Introduced on the Z9000.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |         |             |          |                        |         |                          |

| Version  | Description                              |
|----------|------------------------------------------|
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.7.0  | Introduced on the S4810.                 |
| 8.2.1.0  | Introduced on the E-Series ExaScale.     |
| 7.8.1.0  | Introduced on the C-Series and S-Series. |
| 7.4.1.0  | Introduced on the E-Series TeraScale.    |

## clear ipv6 route

Clear (refresh) all or a specific route from the IPv6 routing table.

### S4820T

**Syntax** `clear ipv6 route [vrf vrf-name] {* | ipv6-address prefix-length}`

#### Parameters

**vrf vrf-name** (Optional) Enter the keyword vrf followed by the name of the VRF to clear the IPv6 routes corresponding to that VRF.

**\*** Enter the \* to clear (refresh) all routes from the IPv6 routing table.

**ipv6-address prefix-length** Enter the IPv6 address in the x:x:x:x::x format then the prefix length in the /x format. The range is from /0 to /128.

**NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 9.7(0.0) | Added support for VRF.    |
| 9.0.0.0  | Introduced on the Z9000.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.7.0  | Introduced on the S4810.  |

| Version | Description                              |
|---------|------------------------------------------|
| 8.2.1.0 | Introduced on the E-Series ExaScale.     |
| 7.8.1.0 | Introduced on the C-Series and S-Series. |
| 7.4.1.0 | Introduced on the E-Series TeraScale.    |

## clear ipv6 mld\_host

Clear the IPv6 MLD host counters and reset the elapsed time.

### S4820T

**Syntax** `clear ipv6 mld_host`

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.12.0 | Introduced on the S4810.  |
| 8.3.11.1 | Introduced on the Z9000.  |

## maximum dynamic-routes-ipv6

Specify the maximum number of dynamic (protocol) IPv6 routes a VRF can have.

### S4820T

**Syntax** `maximum dynamic-routes-ipv6 limit {warn-threshold threshold-value | warning-only}`

To remove the limit on the maximum number of IPv6 routes used, use the `no maximum dynamic-routes-ipv6` command.

## Parameters

|                          |                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>limit</i></b>      | Maximum number of IPv6 routes allowed in a VRF. Valid range is from 1 to 8000 (or maximum allowable for that platform if smaller value).                                                                                                                                                                                                                   |
| <b>warning-threshold</b> | Warning threshold value is expressed as a percentage of the limit value. When the number of IPv6 routes reaches the specified percentage of the limit, a warning message is generated. Valid range is 1 to 100. When warn-threshold is used, once the limit is reached, additional routes will not be allowed into the RTM ( route table manager ) itself. |
| <b>warning-only</b>      | When the warning-only option is used, a syslog message will be thrown when maximum number of dynamic IPv6 routes reaches the limit. Additional dynamic IPv6 routes will still be allowed.                                                                                                                                                                  |

## Defaults

No limit is set on the maximum number of dynamic IPv6 routes for a VRF.

## Command Modes

CONFIGURATION-VRF

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                         |
|----------|---------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, and Z9500. |

## Usage Information

If the maximum IPv6 route limit is not specified for a VRF (valid range is from 1 to 8000), then it has unlimited space that extends to the maximum number of entries allowed for the system. This command is not applicable to the default and management VRFs.

# ipv6 address autoconfig

Configure IPv6 address auto-configuration for the management interface.

## S4820T

### Syntax

```
ipv6 address autoconfig
```

To disable the address autoconfig operation on the management interface, use the `no ipv6 address autoconfig` command.

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Default</b>         | Disabled                                                                                                                                                       |
| <b>Command Modes</b>   | INTERFACE (management interface only)                                                                                                                          |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                        |
|-----------|------------------------------------|
| 9.1.(0.0) | Updated Usage Information section. |
| 8.3.19.0  | Introduced on the S4820T.          |
| 8.3.12.0  | Introduced on the S4810.           |

#### Usage Information

- SAA can configure up to two addresses. If any preferred prefix or valid timers time out, the corresponding address are deprecated or removed. If an address is removed due to a time-out, an address from the current unused prefix is used to create a new address. If there are no remaining prefixes, the software waits to receive a new prefix from the RA.
- If auto-configuration is enabled, all IPv6 addresses on that management interface are auto-configured. Manual and auto-configurations are not supported on a single management interface.
- Removing auto-configuration removes all auto-configured IPv6 addresses and the link-local IPv6 address from that management interface.
- IPv6 addresses on a single management interface cannot be members of the same subnet.
- IPv6 secondary addresses on management interfaces across a platform must be members of the same subnet.
- IPv6 secondary addresses on management interfaces should not match the virtual IP address and should not be in the same subnet as the virtual IP.

## ipv6 address

Configure an IPv6 address to an interface.

### S4820T

|               |                                                                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <code>ipv6 address {ipv6-address prefix-length}</code><br>To remove the IPv6 address, use the <code>no ipv6 address {ipv6-address prefix-length}</code> command. |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Parameters

***ipv6-address***  
***prefix-length***

Enter the IPv6 address in the x:x:x:x format then the prefix length in the /x format. The range is from /0 to /128.

**NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

## Defaults

none

## Command Modes

INTERFACE

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                    |
|----------|------------------------------------------------|
| 9.1(0.0) | Updated Usage Information.                     |
| 9.0.0.0  | Introduced on the Z9000.                       |
| 8.3.19.0 | Introduced on the S4820T.                      |
| 8.3.7.0  | Introduced on the S4810.                       |
| 8.4.1.0  | Added support on the management Ethernet port. |
| 8.2.1.0  | Introduced on the E-Series ExaScale.           |
| 7.8.1.0  | Introduced on the C-Series and S-Series.       |
| 7.4.1.0  | Introduced on the E-Series TeraScale.          |

## Usage Information

- If two addresses are configured, delete an existing address before configuring a new address.
- If the last manually-configured global IPv6 address is removed using the “no” form of the command, the link-local IPv6 address is removed automatically.
- IPv6 addresses on a single management interface cannot be members of the same subnet.
- IPv6 secondary addresses on management interfaces across platform must be members of the same subnet.
- IPv6 secondary addresses on management interfaces should not match the virtual IP address and should not be in the same subnet as the virtual IP.

## Example

```
Dell(conf)#interface tengigabitethernet 1/2
Dell(conf-if-te-1/2)#ipv6 address ?
X:X:X:X::X IPv6 address
Dell(conf-if-te-1/2)#ipv6 address 2002:1:2::3 ?
<0-128> Prefix length in bits
Dell(conf-if-te-1/2)#ipv6 address 2002:1:2::3 /96 ?
<cr>
Dell(conf-if-te-1/2)#ipv6 address 2002:1:2::3 /96
Dell(conf-if-te-1/2)#show config
```

```

!
interface TenGigabitEthernet 1/2
 no ip address
 ipv6 address 2002:1:2::3 /96
 no shutdown

```

## ipv6 address eui64

Configure IPv6 EUI64 address configuration on the interface.

### S4820T

**Syntax** `ipv6 address {ipv6-address prefix-length} eui64`  
 To disable IPv6 EUI64 address autoconfiguration, use the `no ipv6 address {ipv6-address prefix-length} eui64` command.

**Parameters**

|                             |                                                                                                                     |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b><i>ipv6-address</i></b>  | Enter the IPv6 prefix in the x:x:x::x format then the prefix length in the /x format. The range is from /0 to /128. |
| <b><i>prefix-length</i></b> |                                                                                                                     |

 **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

**Defaults** none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.2(0.2) | Introduced.                 |

**Usage Information** This command allows you to create an EUI64 address based on the specified prefix and MAC address only. Prefixes may be configured on the interface using the `ipv6 nd prefix` command without creating an EUI64 address.

**Example**

```

Dell(conf)#int ten 1/4
Dell(conf-if-te-1/4)#ipv6 address 200:1::/64 eui64
Dell(conf)#int ten 1/6
Dell(conf-if-te-1/6)#ipv6 address 801:10::/64 eui64

```

## ipv6 control-plane icmp error-rate-limit

Configure the maximum number of ICMP error packets per second that can be sent per second.

### S4820T

**Syntax** `ipv6 control-plane icmp error-rate-limit {1-200}`  
To restore the default value, use the `no ipv6 control-plane icmp error-rate-limit` command.

**Parameters**

|            |                                                                                                                                 |
|------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>pps</b> | Enter the maximum number of error packets generated per second. The range is from 1 to 200, where 0 disables the rate-limiting. |
|------------|---------------------------------------------------------------------------------------------------------------------------------|

**Default** 100 pps

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.11.1 | Introduced on the Z9000.  |
| 8.3.7.0  | Introduced on the S4810.  |

## ipv6 flowlabel-zero

Configure system to set the flow label field in the packets to zero.

### S4820T

**Syntax** `ipv6 flowlabel-zero`  
To disable the 0 from being set in the field and allow the protocol operations to fill the field, use the `no ipv6 flowlabel-zero` command.

**Default** Disabled

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.11.1 | Introduced on the Z9000.  |
| 8.3.7.0  | Introduced on the S4810.  |

**Usage Information** If the flowlabel value is already set for BGP or SSH, the system defaults to the already configured value. All packets on the same connection are considered part of the same flow by the system. For new connections, set the new flowlabel to zero.

## ipv6 host

Assign a name and IPv6 address the host-to-IPv6 address mapping table uses.

### S4820T

**Syntax** `ipv6 host name ipv6-address`  
To remove an IP host, use the `no ipv6 host name {ipv6-address}`.

**Parameters**

|                            |                                                            |
|----------------------------|------------------------------------------------------------|
| <b><i>name</i></b>         | Enter a text string to associate with one IP address.      |
| <b><i>ipv6-address</i></b> | Enter the IPv6 address (X:X:X:X) to be mapped to the name. |

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version | Description              |
|---------|--------------------------|
| 9.0.0.0 | Introduced on the Z9000. |

| Version  | Description                              |
|----------|------------------------------------------|
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.7.0  | Introduced on the S4810.                 |
| 8.4.2.1  | Introduced on the C-Series and S-Series. |
| 8.4.1.0  | Introduced on the E-Series TeraScale.    |

## ipv6 name-server

Enter up to six IPv6 addresses of name servers. The order you enter the addresses determines the order of their use.

### S4820T

**Syntax** `ipv6 name-server ipv6-address [ipv6-address2... ipv6-address6]`  
 To remove a name server, use the `no ipv6 name-server ipv6-address` command.

**Parameters**

***ipv6-address*** Enter the IPv6 address (X:X:X:X) of the name server to be used.  
 Note: The :: notation specifies successive hexadecimal fields of zeros.

***ipv6-address2...  
 ipv6-address6*** (OPTIONAL) Enter up to five more IPv6 addresses, in the x:x:x:x format, of name servers to be used. Separate the IPv6 addresses with a space.

**Defaults** none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 9.0.0.0  | Introduced on the Z9000.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.7.0  | Introduced on the S4810.  |

| Version | Description                              |
|---------|------------------------------------------|
| 8.4.2.1 | Introduced on the C-Series and S-Series. |
| 8.4.1.0 | Introduced on the E-Series TeraScale.    |

**Usage Information**

You can separately configure both IPv4 and IPv6 domain name servers.

## ipv6 nd dad attempts

To perform duplicate address detection (DAD) on the management interface, configure the number of neighbor solicitation messages that are sent.

### S4820T

**Syntax**

`ipv6 nd dad attempts {number of attempts}`

To restore the default value, use the `no ipv6 nd dad attempts` command.

**Parameters**

*number of attempts*

Enter the number of attempts to be made to detect a duplicate address. The range is from 0 to 15. Setting the value to 0 disables DAD on the interface.

**Default**

3 attempts

**Command Modes**

INTERFACE (management interface only)

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.11.1 | Introduced on the Z9000.  |
| 8.3.7.0  | Introduced on the S4810.  |

## ipv6 nd dns-server

Configures Recursive DNS Server (RDNSS) addresses to be distributed via IPv6 router advertisements to an IPv6 device.

**Syntax** `ipv6 nd dns-server {ipv6-RDNSS-address} {lifetime | infinite}`  
To remove the IPv6 RDSS configuration, use `no ipv6 nd dns-server {ipv6-RDNSS-address} {lifetime | infinite}`

**Parameters**

|                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>ipv6-RDNSS-address</i></b> | Enter the IPv6 Recursive DNS Server's (RDNSS) address. You can specify up to 4 IPv6 RDNSS server addresses.                                                                                                                                                                                                                                                                                                                              |
| <b><i>lifetime</i></b>           | Enter the lifetime in seconds. The amount of time the IPv6 host can use the IPv6 RDNSS address for name resolution. The range is 0 to 4294967295 seconds. When you specify the maximum lifetime value of 4294967295 or <i>infinite</i> , the lifetime does not expire. A value of 0 indicates to the host that the RDNSS address should not be used. You must specify a lifetime using the <i>lifetime</i> or <i>infinite</i> parameter. |
| <b><i>infinite</i></b>           | Enter the keyword <i>infinite</i> to specify that the RDNSS lifetime does not expire.                                                                                                                                                                                                                                                                                                                                                    |

**Defaults** Not Configured

**Command Modes** INTERFACE CONFIG

| <b>Command History</b> | <b>Version</b>  | <b>Description</b>                                       |
|                        | <b>9.7(0.0)</b> | Introduced on the S6000-ON.                              |
|                        | <b>9.5(0.0)</b> | Introduced on the Z9000, S6000, S4810, S4820T, and MXL.. |

**Usage Information** Use this command to add, edit, or delete an IPv6 RDNSS address and lifetime value. You can configure up to four IPv6 RDNSS addresses. You must specify a lifetime using the *lifetime* or *infinite* parameter.

**Example** `Dell(conf-if-te-1/1)#ipv6 nd dns-server 1000::1 1`

# ipv6 nd prefix

Specify which IPv6 prefixes are included in Neighbor Advertisements.

## S4820T

### Syntax

```
ipv6 nd prefix {ipv6-prefix | prefix-length | default} [no-  
advertise] | [no-autoconfig] [no-rtr-address] [off-link]  
[lifetime {valid | infinite} {preferred | infinite}]
```

### Parameters

|                                                |                                                                                                                                                                                                                                                                                                   |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ipv6-prefix</i>                             | Enter an IPv6 prefix.                                                                                                                                                                                                                                                                             |
| <i>prefix-length</i>                           | Enter the prefix then the prefix length. The length range is from 0 to 128.                                                                                                                                                                                                                       |
| <b>default</b>                                 | Enter the keyword <code>default</code> to set default parameters for all prefixes.                                                                                                                                                                                                                |
| <b>no-advertise</b>                            | Enter the keyword <code>no-advertise</code> to prevent the specified prefix from being advertised.                                                                                                                                                                                                |
| <b>no-autoconfig</b>                           | Enter the keywords <code>no-autoconfig</code> to disable Stateless Address Autoconfiguration.                                                                                                                                                                                                     |
| <b>no-rtr-address</b>                          | Enter the keyword <code>no-rtr-address</code> to exclude the full router address from router advertisements (the R bit is not set).                                                                                                                                                               |
| <b>off-link</b>                                | Enter the keywords <code>off-link</code> to advertise the prefix without stating to recipients that the prefix is either on-link or off-link.                                                                                                                                                     |
| <i>valid-lifetime</i>  <br><b>infinite</b>     | Enter the amount of time that the prefix is advertised, or enter <code>infinite</code> for an unlimited amount of time. The range is from 0 to 4294967295. The default is <b>2592000</b> . The maximum value means that the preferred lifetime does not expire for the valid-life time parameter. |
| <i>preferred-lifetime</i>  <br><b>infinite</b> | Enter the amount of time that the prefix is preferred, or enter <code>infinite</code> for an unlimited amount of time. The range is from 0 to 4294967295. The default is <b>604800</b> . The maximum value means that the preferred lifetime and does not expire.                                 |

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                   |
|----------|---------------------------------------------------------------|
| 8.3.19.0 | Introduced on the S4820T.                                     |
| 8.3.11.1 | Introduced on the Z9000.                                      |
| 8.3.7.0  | Introduced on the S4810.                                      |
| 8.3.2.0  | Introduced on the E-Series TeraScale, C-Series, and S-Series. |

### Usage Information

By default, all prefixes configured as addresses on the interface are advertised. This command allows control over the individual parameters per prefix; you can use the `default` keyword to use the default parameters for all prefixes. If a prefix has been configured with lifetime parameter values, the default values cannot be applied using the `ipv6 nd prefix default no-autoconfig` command.

## ipv6 route

Establish a static IPv6 route.

### S4820T

#### Syntax

```
ipv6 route [vrf vrf-name] ipv6-address prefix-length {ipv6-address | interface | interface ipv6-address} [distance] [tag value] [permanent] [weight weight-value]
```

To remove the IPv6 route, use the `no ipv6 route [vrf vrf-name] ipv6-address prefix-length {ipv6-address | interface | interface ipv6-address} [distance] [tag value] [permanent] [weight]` command.

#### Parameters

**vrf vrf-name** (Optional) Enter the keyword `vrf` followed by the name of the VRF to install IPv6 routes in that VRF.

**ipv6-address prefix-length** Enter the IPv6 address in the `x:x:x::x` format then the prefix length in the `/x` format. The range is from `/0` to `/128`.

**NOTE:** The `::` notation specifies successive hexadecimal fields of zeros.

**interface** (OPTIONAL) Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.

- For a port channel interface, enter the keywords `port-channel` then a number.
- For a Null interface, enter the keyword `null` then the Null interface number.
- For a tunnel interface, enter the keyword `tunnel` then the tunnel interface number. The range is from 1 to 16383.
- For a VLAN interface, enter the keyword `VLAN` then the vlan number. The range is from 1 to 4094.

If you configure a static IPv6 route using an egress interface and enter the `ping` command to reach the destination IPv6 address, the ping operation may not work. Configure the IPv6 route using a next-hop IPv6 address in order for the `ping` command to detect the destination address.

|                                   |                                                                                                                                                                                                                                                      |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>ipv6-address</i></b>        | (OPTIONAL) Enter the forwarding router IPv6 address in the <code>x:x:x:x</code> format.                                                                                                                                                              |
|                                   |  <b>NOTE:</b> The <code>::</code> notation specifies successive hexadecimal fields of zeros.                                                                        |
| <b><i>distance</i></b>            | (OPTIONAL) Enter a number as the metric distance assigned to the route. The range is from 1 to 255.                                                                                                                                                  |
| <b><i>tag value</i></b>           | (OPTIONAL) Enter the keyword <code>tag</code> then a tag value number. The range is from 1 to 4294967295.                                                                                                                                            |
| <b><i>permanent</i></b>           | (OPTIONAL) Enter the keyword <code>permanent</code> to specify that the route is not to be removed, even if the interface assigned to that route goes down.                                                                                          |
|                                   |  <b>NOTE:</b> If you disable the interface with an IPv6 address associated with the keyword <code>permanent</code> , the route disappears from the routing table. |
| <b><i>weight weight-value</i></b> | Enter the keyword <code>weight</code> followed by a weight value. The range is from 0 to 255.                                                                                                                                                        |
|                                   |  <b>NOTE:</b> Weight for a static route can be added only for the destination address and not for the route pointing to destination a interface.                  |

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                                                          |
|----------|--------------------------------------------------------------------------------------------------------------------------------------|
| 9.7(0.0) | Added support for VRF. Also included the <code>weight</code> parameter to support weighted ECMP feature. Introduced on the S6000-ON. |
| 9.0.0.0  | Introduced on the Z9000.                                                                                                             |
| 8.3.19.0 | Introduced on the S4820T.                                                                                                            |
| 8.3.7.0  | Introduced on the S4810.                                                                                                             |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale.                                                                                 |
| 8.2.1.0  | Introduced on the E-Series ExaScale.                                                                                                 |
| 7.8.1.0  | Introduced on the C-Series and S-Series.                                                                                             |
| 7.4.1.0  | Introduced on the E-Series TeraScale.                                                                                                |

### Usage Information

When the interface goes down, Dell Networking OS withdraws the route. The route is re-installed, by Dell Networking OS, when the interface comes back up. When a recursive resolution is "broken," Dell Networking OS withdraws the route. The route is re-installed, by Dell Networking OS, when the recursive resolution is satisfied.

After an IPv6 static route interface is created, if an IP address is not assigned to a peer interface, the peer must be manually pinged to resolve the neighbor information.

You can specify a weight for an IPv4 or IPv6 static route. If the weight value of a path is 0, then that path is not used for forwarding when weighted ECMP is in effect. Also, if a path corresponding to a static route (destination) has a non-zero weight assigned to it and other paths do not have any weight configured, then regular ECMP is used for forwarding.

You can specify the weight value only to destination address and not on the egress port.

A route is considered for weighted ECMP calculations only if each paths corresponding to that route is configured with a weight.

### Example

```
Dell(conf)#ipv6 route 44::/64 33::1 weight 100
Dell(conf)#ipv6 route 44::/64 33::2 weight 200
Dell(conf)#do show running-config | grep ipv6 route
Dell(conf)#ipv6 route vrf vrf_test 44::/64 33::1 weight 100
Dell(conf)#ipv6 route vrf vrf_test 44::/64 33::2 weight 200
Dell(conf)#do show running-config | grep ipv6 route vrf
```

### Related Commands

[show ipv6 route](#) — views the IPv6 configured routes.

# ipv6 unicast-routing

Enable IPv6 Unicast routing.

## S4820T

| 7.8.1.0  | Introduced on the C-Series.           |
| 7.4.1.0  | Introduced on the E-Series TeraScale. |

|                          |                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | Because this command is enabled by default, it does not appear in the running configuration. When you disable unicast routing, the <code>no ipv6 unicast-routing</code> command is included in the running configuration. Whenever unicast routing is disabled or re-enabled, Dell Networking OS generates a syslog message indicating the action. |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Disabling unicast routing on an E-Series chassis causes the following behavior:

- static and protocol learned routes are removed from RTM and from the CAM; packet forwarding to these routes is terminated
- connected routes and resolved neighbors remain in the CAM and new IPv6 neighbors are still discoverable
- additional protocol adjacencies (OSPFv3 and BGP4) are brought down and no new adjacencies are formed
- the IPv6 address family configuration (under router bgp) is deleted
- IPv6 Multicast traffic continues to flow unhindered

# show ipv6 cam stack-unit

Displays the IPv6 CAM entries for the specified stack-unit.

## S4820T

**Syntax** `show ipv6 cam [vrf vrf-name] stack-unit unit-number port-set {0-1} [summary | index | ipv6 address]`

### Parameters

**vrf vrf-name** (Optional) Enter the keyword `vrf` followed by the name of the VRF to display IPv6 CAM entries corresponding to that VRF.

**NOTE:** If you do not specify this option, IPv6 CAM entries corresponding to the default VRF are displayed.

**unit-number** Enter the stack unit's ID number.

**port-set** Enter the keyword `Port Set`.

**summary** (OPTIONAL) Enter the keyword `summary` to display a table listing network prefixes and the total number prefixes which can be entered into the IPv6 CAM.

**index** (OPTIONAL) Enter the index in the IPv6 CAM.

**ipv6-address** Enter the IPv6 address in the `x:x:x::x/n` format to display networks that have more specific prefixes. The range is from `/0` to `/128`.

**NOTE:** The `::` notation specifies successive hexadecimal fields of zeros.

**Defaults** none

### Command Modes

- EXEC
- EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Added support for VRF.      |
| 9.0.0.0  | Introduced on the Z9000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.7.1  | Introduced on the S4810.    |
| 8.4.2.1  | Introduced on the S-Series. |

## Usage Information

First-Hop information is not shown for installed routes in the IPv6 content addressable memory (CAM). However, the same is shown in the forwarding information base (FIB).

**NOTE:** If a route has a mask greater than 64, no output is displayed and no output is displayed for `show ipv6 cam stack-unit unit-number port-set {0-1} ipv6-address`, but an equivalent /64 entry would be listed in the `show ipv6 cam stack-unit unit-number port-set {0-1}` output. Similarly, if there is more than one ECMP object with a destination route that has a mask greater than 64, if the first 64 bits in the destination routes of the ECMP objects are the same, only one route is installed in CAM even though multiple ECMP path entries exist.

**NOTE:** The self address is displayed in the neighbor portion for the `show ipv6 cam stack-unit unit-number port-set` command.

## show ipv6 control-plane icmp

Displays the status of the icmp control-plane setting for the error eate limit setting.

### S4820T

**Syntax** `show ipv6 control-plane icmp`

**Default** 100

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.11.1 | Introduced on the Z9000.  |
| 8.3.7.0  | Introduced on the S4810.  |

**Related Commands** [ipv6 flowlabel-zero](#) — Configure IPv6 address auto-configuration for the management interface.

# show ipv6 fib stack-unit

View all FIB entries.

## S4820T

**Syntax** `show ipv6 fib [vrf vrf-name] stack-unit unit-number [summary | ipv6-address]`

**Parameters**

|                     |                                                                                                                                                                             |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf vrf-name</b> | (Optional) Enter the keyword <code>vrf</code> followed by the name of the VRF to display neighbors corresponding to that VRF.                                               |
| <b>slot-number</b>  | Enter the number of the stack unit.                                                                                                                                         |
| <b>summary</b>      | (OPTIONAL) Enter the keyword <code>summary</code> to view a summary of entries in IPv6 cam.                                                                                 |
| <b>ipv6-address</b> | Enter the IPv6 address in the <code>x:x:x::x/n</code> format to display networks that have more specific prefixes. The range is from <code>/0</code> to <code>/128</code> . |

**NOTE:** The `::` notation specifies successive hexadecimal fields of zeros.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Added support for VRF.      |
| 9.0.0.0  | Introduced on the Z9000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.7.0  | Introduced on the S4810.    |
| 8.4.2.1  | Introduced on the S-Series. |

**Usage Information** Host tables are not stored in CAM tables on S-Series platforms. Entries for `camIndex` displays as zero (0) on the `show ipv6 fib stack-unit` output for neighbor entries, such as address resolution protocol (ARP) entries.

# show ipv6 flowlabel-zero

Display the flow label zero setting.

## S4820T

**Syntax** `show ipv6 flowlabel-zero`

**Default** Disabled

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.11.1 | Introduced on the Z9000.  |
| 8.3.7.0  | Introduced on the S4810.  |

**Related Commands** [ipv6 nd dad attempts](#) – Configure system to set the flow label field in the packets to zero.

# show ipv6 interface

Display the status of interfaces configured for IPv6.

## S4820T

**Syntax** `show ipv6 interface interface [brief] [configured] [loopback interface-number] [managementethernet slot/port] [port-channel number] [stack-unit id] [tengigabitethernet slot | slot/port] [fortyGigE slot | slot/port] [tunnel tunnel-id] [vlan vlan-id]`

**Parameters** *interface* (OPTIONAL) Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.

- For a port channel interface, enter the keywords `port-channel` then a number.
- For a Null interface, enter the keyword `null` then the Null interface number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- For stacking, enter the keywords `stack-unit` then the stack-unit ID.
- For a tunnel interface, enter the keyword `tunnel` then the tunnel ID.

|                                     |                                                                                                               |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <b>brief</b>                        | (OPTIONAL) View a summary of IPv6 interfaces.                                                                 |
| <b>configured</b>                   | (OPTIONAL) View information on all IPv6 configured interfaces.                                                |
| <b>managementethernet slot/port</b> | (OPTIONAL) View information on an IPv6 Management port. Enter the slot number (0-1) and port number zero (0). |
| <b>loopback</b>                     | (OPTIONAL) View information for IPv6 Loopback interfaces.                                                     |
| <b>port-channel</b>                 | (OPTIONAL) View information for IPv6 port channels.                                                           |
| <b>tengigabitethernet</b>           | (OPTIONAL) View information for an IPv6 tengigabitethernet interface.                                         |
| <b>fortyGigE</b>                    | (OPTIONAL) View information for an IPv6 fortygigabitethernet interface.                                       |
| <b>stack-unit id</b>                | (OPTIONAL) View information for stacking.                                                                     |
| <b>tunnel tunnel-id</b>             | (OPTIONAL) View information for a tunnel interface.                                                           |
| <b>vlan</b>                         | (OPTIONAL) View information for IPv6 VLANs.                                                                   |

#### Defaults

- EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version          | Description                         |
|------------------|-------------------------------------|
| <b>9.2.(0.0)</b> | Added support for tunnel interface. |
| <b>9.0.0.0</b>   | Introduced on the Z9000.            |
| <b>8.3.19.0</b>  | Introduced on the S4820T.           |
| <b>8.3.7.0</b>   | Introduced on the S4810.            |

| Version | Description                                                                                        |
|---------|----------------------------------------------------------------------------------------------------|
| 8.5.1.0 | Added support for 4-port 40G line cards on ExaScale.                                               |
| 8.4.2.1 | Introduced on the S-Series.                                                                        |
| 8.2.1.0 | Introduced on the E-Series ExaScale. Added support for the managementethernet slot/port parameter. |
| 7.8.1.0 | Introduced on the C-Series.                                                                        |
| 7.4.1.0 | Introduced on the E-Series TeraScale.                                                              |

**Usage Information**

The Management port is enabled by default (no shutdown). If necessary, use the `ipv6 address` command to assign an IPv6 address to the Management port.

**Example**

```
Dell#show ipv6 interface tengigabit 1/12
TenGigabitEthernet 1/12 is up, line protocol is up
  IPv6 is enabled
  Link Local address: fe80::201:e8ff:fea7:497e
  Global Unicast address(es):
    100::2, subnet is 100::/64 (MANUAL)
    Remaining lifetime: infinite
  Global Anycast address(es):
  Joined Group address(es):
    ff02::1
    ff02::2
    ff02::1:ff00:2
    ff02::1:ffa7:497e
  ND MTU is 0
  ICMP redirects are not sent
  DAD is enabled, number of DAD attempts: 3
  ND reachable time is 39610 milliseconds
  ND base reachable time is 30000 milliseconds
  ND advertised reachable time is 0 milliseconds
  ND advertised retransmit interval is 0 milliseconds
  ND router advertisements are sent every 198 to 600 seconds
  ND router advertisements live for 1800 seconds
  ND advertised hop limit is 64
  IPv6 hop limit for originated packets is 64
```

Dell#

**Example (Managementethernet)**

```
Dell#show ipv6 interface management 0/0
ManagementEthernet 0/0 is up, line protocol is up
  IPv6 is enabled
  Link Local address: fe80::201:e8ff:fea7:497e
  Global Unicast address(es):
    Actual address is 300::1, subnet is 300::/64 (MANUAL)
    Remaining lifetime: infinite
  Virtual-IP IPv6 address is not set
  Global Anycast address(es):
  Joined Group address(es):
    ff02::1
    ff02::1:ff00:1
    ff02::1:ffa7:497e
  ND MTU is 0
  ICMP redirects are not sent
  DAD is enabled, number of DAD attempts: 3
  ND reachable time is 20410 milliseconds
  ND base reachable time is 30000 milliseconds
  ND retransmit interval is 1000 milliseconds
```

```
ND hop limit is 64
```

```
Dell#
```

#### Example (Brief)

```
Dell#show ipv6 interface brief
TenGigabitEthernet 1/2      [administratively down/down]
    fe80::201:e8ff:fea7:497e
    2002:1:2::3/96
TenGigabitEthernet 1/12     [up/up]
    fe80::201:e8ff:fea7:497e
    100::2/64
ManagementEthernet 1/0     [up/up]
    fe80::201:e8ff:fea7:497e
    300::1/64
Dell#
```

#### Example (tunnel)

```
Dell#show ipv6 interface tunnel 1
Tunnel 1 is up, line protocol is up
IPV6 is enabled
Link Local address: fe80::201:e8ff:fea7:497e
Global Unicast address(es):
    400::1, subnet is 400::/64 (MANUAL)
    Remaining lifetime: infinite
Global Anycast address(es):
Joined Group address(es):
    ff02::1
    ff02::2
    ff02::1:ff00:1
    ff02::1:ffa7:497e
ND MTU is 0
ICMP redirects are not sent
DAD is enabled, number of DAD attempts: 3
ND reachable time is 20410 milliseconds
ND base reachable time is 30000 milliseconds
ND advertised reachable time is 0 milliseconds
ND advertised retransmit interval is 0 milliseconds
ND router advertisements are sent every 198 to 600 seconds
ND router advertisements live for 1800 seconds
ND advertised hop limit is 64
IPv6 hop limit for originated packets is 64
```

## show ipv6 mld\_host

Display the IPv6 MLD host counters.

### S4820T

|                      |                    |
|----------------------|--------------------|
| <b>Syntax</b>        | show ipv6 mld_host |
| <b>Command Modes</b> | EXEC               |

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.11.1 | Introduced on the Z9000.  |
| 8.3.7.0  | Introduced on the S4810.  |

## Usage Information

The following describes the `show ipv6 mld-host` command shown in the following example.

| Field             | Description                                                                                                                   |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------|
| Valid MLD Packets | The total number of packets received and sent from the last time the elapsed time was cleared.                                |
| Reports           | The total number of reports (queries and unsolicited reports generated from joins or leaves) that have been received or sent. |
| Leaves            | The number of Multicast leaves that have been sent.                                                                           |
| MLDv1 queries     | The number of MLDv1 queries that have been received.                                                                          |
| MLDv2 queries     | The number of MLDv2 queries that have been received.                                                                          |
| Malformed Packets | The number of MLDv1 and MLDv2 packets that do not match the requirement for a valid MLD packet.                               |

## Example

```
MLD Host Traffic Counters
Elapsed time since counters cleared: 0028:33:52
Received      Sent
Valid MLD Packets  97962    18036
Reports        79962    18034
Leaves         ----     0
MLDv2 Queries  18000    ----
MLDv1 Queries   0        ----
Errors:
Malformed Packets: 4510
```

# show ipv6 route

Displays the IPv6 routes.

## S4820T

### Syntax

```
show ipv6 route [ipv6-address prefix-length] [vrf vrf-name]
[hostname] [all] [bgp as number] [connected] [isis tag] [list
prefix-list name] [ospf process-id] [rip] [static] [summary]
```

### Parameters

**ipv6-address**  
**prefix-length**

(OPTIONAL) Enter the IPv6 address in the x:x:x:x format then the prefix length in the /x format. The range is from /0 to /128.

**NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

**vrf vrf-name**

(Optional) Enter the keyword vrf followed by the name of the VRF to display IPv6 routes corresponding to that VRF.

**NOTE:** If you do not specify this option, routes corresponding to the default VRF are displayed.

**hostname**

(OPTIONAL) View information for this IPv6 routes with Host Name.

**all**

(OPTIONAL) View information for all IPv6 routes.

**bgp**

(OPTIONAL) View information for all IPv6 BGP routes.

**connected**

(OPTIONAL) View only the directly connected IPv6 routes.

**isis**

(OPTIONAL) View information for all IPv6 IS-IS routes.

**list**

(OPTIONAL) View the IPv6 prefix list.

**ospf**

(OPTIONAL) View information for all IPv6 OSPF routes.

**rip**

(OPTIONAL for E-Series only) View information for all IPv6 RIP routes.

**static**

(OPTIONAL) View only routes configured by the `ipv6 route` command.

**summary**

(OPTIONAL) View a brief list of the configured IPv6 routes.

### Defaults

none

### Command Modes

- EXEC
- EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                   |
|----------|-----------------------------------------------|
| 9.7(0.0) | Added support for VRF. Introduced on S6000-ON |
| 9.0.0.0  | Introduced on the Z9000.                      |
| 8.3.19.0 | Introduced on the S4820T.                     |
| 8.3.7.0  | Introduced on the S4810.                      |
| 8.2.1.0  | Introduced on the E-Series ExaScale.          |
| 7.8.1.0  | Introduced on the C-Series and S-Series.      |
| 7.4.1.0  | Introduced on the E-Series TeraScale.         |

### Usage Information

The following describes the `show ipv6 route` command shown in the following examples.

| Field       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| (undefined) | <p>Identifies the type of route:</p> <ul style="list-style-type: none"> <li>• L = Local</li> <li>• C = connected</li> <li>• S = static</li> <li>• R = RIP</li> <li>• B = BGP</li> <li>• IN = internal BGP</li> <li>• EX = external BGP</li> <li>• LO = Locally Originated</li> <li>• O = OSPF</li> <li>• IA = OSPF inter-area</li> <li>• N1 = OSPF NSSA external type 1</li> <li>• N2 = OSPF NSSA external type 2</li> <li>• E1 = OSPF external type 1</li> <li>• E2 = OSPF external type 2</li> <li>• i = IS-IS</li> <li>• L1 = IS-IS level-1</li> <li>• L2 = IS-IS level-2</li> <li>• IA = IS-IS inter-area</li> <li>• * = candidate default</li> <li>• &gt; = non-active route</li> <li>• + = summary routes</li> </ul> |
| Destination | Identifies the route's destination IPv6 address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Gateway     | Identifies whether the route is directly connected and on which interface the route is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Field       | Description                                                 |
|-------------|-------------------------------------------------------------|
| Dist/Metric | Identifies if the route has a specified distance or metric. |
| Last Change | Identifies when the route was last changed or configured.   |

**Example (S-Series)**

```
Dell#show ipv6 route
Codes: C - connected, L - local, S - static, R - RIP,
       B - BGP, IN - internal BGP, EX - external BGP, LO -
Locally Originated,
       O - OSPF, IA - OSPF inter area, N1 - OSPF NSSA external
type 1,
       N2 - OSPF NSSA external type 2, E1 - OSPF external type
1,
       E2 - OSPF external type 2, i - IS-IS, L1 - IS-IS
level-1,
       L2 - IS-IS level-2, IA - IS-IS inter area, * -
candidate default,
Gateway of last resort is not set
```

|   | Destination     | Dist/Metric, | Gateway,   | Last Change |
|---|-----------------|--------------|------------|-------------|
| C | 100::/64 [0/0]  | Direct,      | Te 1/12/1, | 20:00:18    |
| C | 400::/64 [0/0]  | Direct,      | Tu 1,      | 00:09:02    |
| S | 800::/64 [1/0]  | via 100::1,  | Te 1/12/1, | 00:00:50    |
| L | fe80::/10 [0/0] | Direct,      | Nu 0,      | 20:00:18    |

Dell#

```
Dell#show ipv6 route
Codes: C - connected, L - local, S - static, R - RIP,
       B - BGP, IN - internal BGP, EX - external BGP, LO -
Locally Originated,
       O - OSPF, IA - OSPF inter area, N1 - OSPF NSSA external
type 1,
       N2 - OSPF NSSA external type 2, E1 - OSPF external type
1,
       E2 - OSPF external type 2, i - IS-IS, L1 - IS-IS
level-1,
       L2 - IS-IS level-2, IA - IS-IS inter area, * -
candidate default,
Gateway of last resort is not set
```

|   | Destination     | Dist/Metric, | Gateway, | Last Change |
|---|-----------------|--------------|----------|-------------|
| C | 100::/64 [0/0]  | Direct,      | Te 1/12, | 20:00:18    |
| C | 400::/64 [0/0]  | Direct,      | Tu 1,    | 00:09:02    |
| S | 800::/64 [1/0]  | via 100::1,  | Te 1/12, | 00:00:50    |
| L | fe80::/10 [0/0] | Direct,      | Nu 0,    | 20:00:18    |

Dell#

**Example  
(Summary)**

```
show ipv6 route summary:
=====
Dell#show ipv6 route summary

Route Source           Active Routes   Non-active Routes
connected              3                0
static                 1                0
Total                  4                0
Total 4 active route(s) using 928 bytes
Dell#
```

## trust ipv6-diffserv

Allows the dynamic classification of IPv6 DSCP.

### S4820T

**Syntax**

```
trust ipv6-diffserv
```

To remove the definition, use the `no trust ipv6-diffserv` command.

**Defaults**

none

**Command  
Modes**

CONFIGURATION-POLICY-MAP-IN

**Command  
History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.7.0  | Introduced on the S4810.                 |
| 8.4.2.1  | Introduced on the C-Series and S-Series. |
| 8.2.1.0  | Introduced on the E-Series ExaScale.     |
| 7.4.1.0  | Introduced on the E-Series TeraScale.    |

**Usage  
Information**

When you configure trust IPv6 diffserv, matched bytes/packets counters are not incremented in the `show qos statistics` command.

Trust diffserv (IPv4) can co-exist with trust ipv6-diffserv in an Input Policy Map. Dynamic classification happens based on the mapping as shown:

| IPv6 Service Class<br>Field | Queue ID |
|-----------------------------|----------|
| 111XXXXX                    | 7        |
| 110XXXXX                    | 6        |
| 101XXXXX                    | 5        |
| 100XXXXX                    | 4        |
| 011XXXXX                    | 3        |
| 010XXXXX                    | 2        |
| 001XXXXX                    | 1        |
| 000XXXXX                    | 0        |

# iSCSI Optimization

Internet small computer system interface (iSCSI) optimization enables quality-of-service (QoS) treatment for iSCSI storage traffic on an S4820T system.

To configure and verify the iSCSI optimization feature, use the following Dell Networking OS commands.

## advertise dcbx-app-tlv

Configure DCBX to send iSCSI TLV advertisements.

### S4820T

**Syntax** `advertise dcbx-app-tlv iscsi`  
To disable DCBX iSCSI TLV advertisements, use the `no advertise dcbx-app-tlv iscsi` command.

**Defaults** Disabled.

**Command Modes** PROTOCOL LLDP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                  |
|----------|----------------------------------------------|
| 8.3.19.0 | Introduced on the S4820T.                    |
| 8.3.12.0 | Introduced on the S4810.                     |
| 8.3.16.0 | Introduced on MXL 10/40GbE Switch IO Module. |

**Usage Information** You can configure iSCSI TLVs to send either globally or on a specified interface. The interface configuration takes priority over global configuration.

## iscsi aging time

Set the aging time for iSCSI sessions.

### S4820T

|                        |                                                                                                                                                                |                    |                                                                                    |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>iscsi aging time <i>time</i></code><br>To remove the iSCSI session aging time, use the <code>no iscsi aging time</code> command.                         |                    |                                                                                    |
| <b>Parameters</b>      | <table><tr><td><b><i>time</i></b></td><td>Enter the aging time for the iSCSI session. The range is from 5 to 43,200 minutes.</td></tr></table>                 | <b><i>time</i></b> | Enter the aging time for the iSCSI session. The range is from 5 to 43,200 minutes. |
| <b><i>time</i></b>     | Enter the aging time for the iSCSI session. The range is from 5 to 43,200 minutes.                                                                             |                    |                                                                                    |
| <b>Defaults</b>        | <b>10 minutes</b>                                                                                                                                              |                    |                                                                                    |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                  |                    |                                                                                    |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |                    |                                                                                    |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                  |
|----------|----------------------------------------------|
| 8.3.19.0 | Introduced on the S4820T.                    |
| 8.3.12.0 | Introduced on the S4810.                     |
| 8.3.16.0 | Introduced on MXL 10/40GbE Switch IO Module. |

## iscsi cos

Set the QoS policy that is applied to the iSCSI flows.

### S4820T

|                   |                                                                                                                                                                                                                                                                                                                   |               |                                                                                                                                                                                                                                                            |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>iscsi cos {enable   disable   dot1p <i>vlan-priority-value</i> [remark]   dscp <i>dscp-value</i> [remark]}</code><br>To disable the QoS policy, use the <code>no iscsi cos</code> command.                                                                                                                  |               |                                                                                                                                                                                                                                                            |
| <b>Parameters</b> | <table><tr><td><b>enable</b></td><td>Enter the keyword <code>enable</code> to allow the application of preferential QoS treatment to iSCSI traffic so that the iSCSI packets are scheduled in the switch with a dot1p priority 4 regardless of the VLAN priority tag in the packet. The default</td></tr></table> | <b>enable</b> | Enter the keyword <code>enable</code> to allow the application of preferential QoS treatment to iSCSI traffic so that the iSCSI packets are scheduled in the switch with a dot1p priority 4 regardless of the VLAN priority tag in the packet. The default |
| <b>enable</b>     | Enter the keyword <code>enable</code> to allow the application of preferential QoS treatment to iSCSI traffic so that the iSCSI packets are scheduled in the switch with a dot1p priority 4 regardless of the VLAN priority tag in the packet. The default                                                        |               |                                                                                                                                                                                                                                                            |

is: the iSCSI packets are handled with dotp1 priority 4 without remark.

|                                  |                                                                                                                                                                                                                                                                                                                                      |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>disable</b>                   | Enter the keyword <code>disable</code> to disable the application of preferential QoS treatment to iSCSI frames.                                                                                                                                                                                                                     |
| <b>dot1p vlan-priority-value</b> | Enter the dot1p value of the VLAN priority tag assigned to the incoming packets in an iSCSI session. The range is from 0 to 7. The default is the dot1p value in ingress iSCSI frames is not changed and is the same priority is used in iSCSI TLV advertisements if you did not enter the <code>iscsi priority-bits</code> command. |
| <b>dscp dscp-value</b>           | Enter the DSCP value assigned to the incoming packets in an iSCSI session. The valid range is from 0 to 63. The default is: the DSCP value in ingress packets is not changed.                                                                                                                                                        |
| <b>remark</b>                    | Marks the incoming iSCSI packets with the configured dot1p or DSCP value when they egress to the switch. The default is: the dot1and DSCP values in egress packets are not changed.                                                                                                                                                  |

**Defaults** Disabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                  |
|----------|----------------------------------------------|
| 8.3.19.0 | Introduced on the S4820T.                    |
| 8.3.12.0 | Introduced on the S4810.                     |
| 8.3.16.0 | Introduced on MXL 10/40GbE Switch IO Module. |

**Usage Information** By default, iSCSI flows are assigned to dot1p priority 4.

## iscsi enable

Globally enable iSCSI optimization.

### S4820T

**Syntax** `iscsi enable`  
To disable iSCSI optimization, use the `no iscsi enable` command.

**Parameters**                    **enable**                    Enter the keyword `enable` to enable the iSCSI optimization feature.

**Defaults**                    Disabled.

**Command Modes**            CONFIGURATION

**Command History**            This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                  |
|----------|----------------------------------------------|
| 8.3.19.0 | Introduced on the S4820T.                    |
| 8.3.12.0 | Introduced on the S4810.                     |
| 8.3.16.0 | Introduced on MXL 10/40GbE Switch IO Module. |

## iscsi priority-bits

Configure the priority bitmap that advertises in the iSCSI application TLVs.

### S4820T

**Syntax**                    `iscsi priority-bits`  
To remove the configured priority bitmap, use the `no iscsi priority-bits` command.

**Defaults**                    **4** (0x10 in the bitmap)

**Command Modes**            PROTOCOL LLDP (only on the global, not on the interface)

**Command History**            This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                  |
|----------|----------------------------------------------|
| 8.3.19.0 | Introduced on the S4820T.                    |
| 8.3.12.0 | Introduced on the S4810.                     |
| 8.3.16.0 | Introduced on MXL 10/40GbE Switch IO Module. |

## iscsi profile-compellant

Configure the auto-detection of Dell Compellent arrays on a port.

### S4820T

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>iscsi profile-compellent</code>                                                                                                                          |
| <b>Defaults</b>        | Dell Compellent disk arrays are not detected.                                                                                                                  |
| <b>Command Modes</b>   | INTERFACE                                                                                                                                                      |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                  |
|----------|----------------------------------------------|
| 8.3.19.0 | Introduced on the S4820T.                    |
| 8.3.12.0 | Introduced on the S4810.                     |
| 8.3.16.0 | Introduced on MXL 10/40GbE Switch IO Module. |

## iscsi target port

Configure the iSCSI target ports and optionally, the IP addresses on which iSCSI communication is monitored.

### S4820T

**Syntax** `iscsi target port [tcp-port-2...tcp-port-16] ip-address [ip-address]`

To remove the configured iSCSI target ports or IP addresses, use the `no iscsi target port` command.

|                   |                                       |                                                                                                                                                                                                                                                             |
|-------------------|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b><i>tcp-port-2...tcpport-16</i></b> | Enter the <i>tcp-port</i> number of the iSCSI target ports. The <i>tcp-port-n</i> is the TCP port number or a list of TCP port numbers on which the iSCSI target listens to requests. Separate port numbers with a comma. The default is <b>860, 3260</b> . |
|                   | <b><i>ip-address</i> (Optional)</b>   | Enter the <i>ip-address</i> that the iSCSI monitors. The <i>ip-address</i> specifies the IP address of the iSCSI target.                                                                                                                                    |

| <b>Defaults</b>          | <b>860, 3260</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |         |             |                 |                           |                 |                          |                 |                                              |

## show iscsi session

Display information about active iSCSI sessions on the switch.

**Syntax** `show iscsi session`

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                  |
|----------|----------------------------------------------|
| 8.3.19.0 | Introduced on the S4820T.                    |
| 8.3.12.0 | Introduced on the S4810.                     |
| 8.3.16.0 | Introduced on MXL 10/40GbE Switch IO Module. |

#### Example

```
Dell# show iscsi session
Session 0:
-----
Target: iqn.2001-05.com.equallogic:
0-8a0906-0e70c2002-10a0018426a48c94-iom010
Initiator: iqn.1991-05.com.microsoft:win-x918v27yajg
ISID: 400001370000

Session 1:
-----
Target: iqn.2001-05.com.equallogic:
0-8a0906-0f60c2002-0360018428d48c94-iom011
```

```
Initiator: iqn.1991-05.com.microsoft:win-x918v27yajg
ISID: 400001370000.
```

### Usage Information

Only sessions the switch observes are learned; sessions flowing through an adjacent switch are not learned.

After the switch is reloaded, any information exchanged during the initial handshake is not available. If the switch picks up the communication after reloading, it would detect a session was in progress but could not obtain complete information for it. Any incomplete information of this type would not be available in the `show` commands.

# Intermediate System to Intermediate System (IS-IS)

The intermediate system to intermediate system (IS-IS) protocol for IPv4 and IPv6 is supported on the S4820T platform.

IS-IS is an interior gateway protocol that uses a shortest-path-first algorithm. IS-IS facilitates the communication between open systems, supporting routers passing both IP and OSI traffic.

A router is considered an intermediate system. Networks are partitioned into manageable routing domains, called areas. Intermediate systems send, receive, and forward packets to other routers within their area (Level 1 and Level 1-2 devices). Only Level 1-2 and Level 2 devices communicate with other areas.

IS-IS protocol standards are listed in the Standard Compliance chapter in the *Dell Networking OS Configuration Guide*.

 **NOTE:** The fundamental mechanisms of IS-IS are the same between IPv4 and IPv6. Where there are differences between the two versions, they are identified and clarified in this chapter. Except where identified, the information in this chapter applies to both protocol versions.

## adjacency-check

Verify that the “protocols supported” field of the IS-IS neighbor contains matching values to this router.

|                        |                                                                                                                                                                                                                                                                 |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | adjacency-check<br>To disable adjacency check, use the <code>no adjacency-check</code> command.                                                                                                                                                                 |
| <b>Defaults</b>        | Enabled.                                                                                                                                                                                                                                                        |
| <b>Command Modes</b>   | <ul style="list-style-type: none"> <li>ROUTER ISIS (<i>for IPv4</i>)</li> <li>CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (<i>for IPv6</i>)</li> </ul>                                                                                                        |
| <b>Command History</b> | <p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> |

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.12.0 | Introduced on the S4810.    |
| 8.3.11.1 | Introduced on the Z9000.    |
| 7.5.1.0  | Introduced on the E-Series. |

### Usage Information

To perform protocol-support consistency checks on hello packets, use this command. The adjacency-check is enabled by default.

If a BFD session goes down indicating that IPv4 or IPv6 connectivity to its neighbor is lost, it does not imply that the adjacency is lost altogether. The hello adjacency runs over Layer 2, and does not require IP connectivity. However, if IPv4 connectivity is lost to a neighbor, then when the next SPF calculation is performed, the system ensures that it does not calculate any IPv4 or IPv6 routes through that neighbor.

## advertise

Leak routes between levels (distribute IP prefixes between Level 1 and Level 2 and vice versa).

**Syntax** `advertise {level1-into-level2 | level2-into-level1} prefix-list-name`

To return to the default, use the `no advertise {level1-into-level2 | level2-into-level1} [prefix-list-name]` command.

### Parameters

|                           |                                                                                                                                                      |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>level1-into-level2</b> | Enter the keywords <code>level1-into-level2</code> to advertise Level 1 routes into Level 2 LSPs. This setting is the default.                       |
| <b>level2-into-level1</b> | Enter the keywords <code>level2-into-level1</code> to advertise Level 2 inter-area routes into Level 1 LSPs. This behavior is described in RFC 2966. |
| <b>prefix-list-name</b>   | Enter the name of a configured IP prefix list. Routes meeting the criteria of the IP Prefix list are leaked.                                         |

### Defaults

**level1-into-level2** (Level 1 to Level 2 leaking is enabled.)  
**level2-into-level1** (Level 2 to Level 1) leaking is disabled.

### Command Modes

- ROUTER ISIS (*for IPv4*)

- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (for IPv6)

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.12.0 | Introduced on the S4810.    |
| 8.3.11.1 | Introduced on the Z9000.    |
| 7.5.1.0  | Added IPv6 ISIS support.    |
| 6.3.1.0  | Version 6.3.1.0 Introduced  |

**Usage Information**

You cannot disable leaking from Level 1 to Level 2. Also, you cannot enable leaking from Level 2 to Level 1. However, you can regulate the rate flow from one level to another using an IP Prefix list. If you do not configure the IP Prefix list, all Level 1 routes are leaked.

You can find more information in IETF RFC 2966, *Domain-wide Prefix Distribution with Two-Level IS-IS*.

## area-password

Configure a hash message authentication code (HMAC) password for an area.

**Syntax** `area-password [hmac-md5 | encryption-type] password`  
 To delete a password, use the `no area-password` command.

**Parameters**

|                        |                                                                                                                                                                                                                                         |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>hmac-md5</b>        | (OPTIONAL) Enter the keywords <code>hmac-md5</code> to encrypt the password.                                                                                                                                                            |
| <b>encryption-type</b> | (OPTIONAL) Enter <code>7</code> to encrypt the password using DES.                                                                                                                                                                      |
| <b>password</b>        | Enter a 1 to 16-character length alphanumeric string to prevent unauthorized access or incorrect routing information corrupting the link state database. The password is processed as plain text, which only provides limited security. |

| <b>Defaults</b>          | Not configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |         |             |          |                             |         |                          |          |                           |          |                          |          |                          |

| <b>Command History</b> | <p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> |

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.1  | Introduced on the S4810.    |

#### Usage Information

**CAUTION: Use caution when you enter this command. Back up your configuration prior to using this command or your IS-IS configuration will be erased.**

## clear isis

Restart the IS-IS process. All IS-IS data is cleared.

### S4820T

#### Syntax

```
clear isis [vrf vrf-name] [tag] {* | database | traffic}
```

#### Parameters

|                     |                                                                                                                                                                                                            |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf vrf-name</b> | (Optional) Enter the keyword vrf followed by the name of the VRF to restart the IS-IS process corresponding to that VRF.                                                                                   |
| <b>tag</b>          | (Optional) Enter an alphanumeric string to specify the IS-IS routing tag area.                                                                                                                             |
| <b>*</b>            | Enter the keyword * to clear all IS-IS information and restart the IS-IS process. This command removes IS-IS neighbor information and IS-IS LSP database information and the full SPF calculation is done. |
| <b>database</b>     | Clears IS-IS LSP database information.                                                                                                                                                                     |
| <b>traffic</b>      | Clears IS-IS counters.                                                                                                                                                                                     |

#### Command Modes

EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Added support for VRF. Introduced on the S6000-ON. |

| Version  | Description               |
|----------|---------------------------|
| 9.0.2.0  | Introduced on the S6000.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.12.0 | Introduced on the S4810.  |
| 8.3.11.1 | Introduced on the Z9000.  |

## clns host

Define a name-to-network service mapping point (NSAP) that you use with commands that require NSAPs and system IDs.

**Syntax** `clns host name nsap`

**Parameters**

|             |                                                                           |
|-------------|---------------------------------------------------------------------------|
| <b>name</b> | Enter an alphanumeric string to identify the name-to-NSAP mapping.        |
| <b>nsap</b> | Enter a specific NSAP address that is associated with the name parameter. |

**Defaults** Not configured.

**Command Modes** ROUTER ISIS

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.12.0 | Introduced on the S4810.    |
| 8.3.11.1 | Introduced on the Z9000.    |

**Usage Information** To configure a shortcut name that you can use instead of entering a long string of numbers associated with an NSAP address, use this command.

**Related Commands** [hostname dynamic](#) — enables dynamic learning of host names from routers in the domain and allows the routers to advertise the host names in LSPs.

# debug isis

Enable debugging for all IS-IS operations.

**Syntax**                    `debug isis`  
To disable debugging of IS-IS, use the `no debug isis` command.

**Command Modes**            EXEC Privilege

**Command History**           This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.12.0 | Introduced on the S4810.    |
| 8.3.11.1 | Introduced on the Z9000.    |

**Usage Information**            Entering `debug isis` enables all debugging parameters.

To display all debugging information in one output, use this command. To turn off debugging, you normally enter separate `no` forms of each command. To disable all debug messages for IS-IS at once, enter the `no debug isis` command.

# debug isis adj-packets

Enable debugging on adjacency-related activity such as hello packets that are sent and received on IS-IS adjacencies.

## S4820T

**Syntax**                    `debug isis [vrf vrf-name] adj-packets [interface]`  
To turn off debugging, use the `no debug isis [vrf vrf-name]adj-packets [interface]` command.

**Parameters**                **vrf vrf-name**            (Optional) Enter the keyword `vrf` followed by the name of the VRF to enable the debug information on IS-IS for an

adjacency tied to that VRF. This command displays the I1H related debug details.

***interface***

(OPTIONAL) Identifies the interface type slot/port as one of the following:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Added support for VRF. Introduced on the S6000-ON. |
| 9.2(0.2) | Introduced on the Z9000.                           |
| 9.0.2.0  | Introduced on the S6000.                           |
| 8.3.19.0 | Introduced on the S4820T.                          |
| 8.3.12.0 | Introduced on the S4810.                           |

## debug isis local-updates

To debug IS-IS local update packets, enable debugging on a specific interface and provides diagnostic information.

### S4820T

**Syntax**

```
debug isis [vrf vrf-name] local-updates [interface]
```

To turn off debugging, use the `no debug isis [vrf vrf-name] updates [interface]` command.

**Parameters**

**vrf vrf-name**

(OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to enable the debugging information on IS-IS

corresponding to that VRF. This information contains local updates tied to the VRF that you specify. This command displays the local LSP debugging details of the current unit.

***interface***

(OPTIONAL) Identifies the interface type slot/port as one of the following:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Added support for VRF. Introduced on the S6000-ON. |
| 9.2(0.2) | Introduced on the Z9000.                           |
| 9.0.2.0  | Introduced on the S6000.                           |
| 8.3.19.0 | Introduced on the S4820T.                          |
| 8.3.12.0 | Introduced on the S4810.                           |
| 6.3.1.0  | Introduced.                                        |

## debug isis snp-packets

To debug IS-IS complete sequence number PDU (CSNP) and partial sequence number PDU (PSNP) packets, enable debugging on a specific interface and provides diagnostic information.

### S4820T

**Syntax**

```
debug isis [vrf vrf-name] snp-packets [interface]
```

To turn off debugging, use the `no debug isis [vrf vrf-name] snp-packets [interface]` command.

## Parameters

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf vrf-name</b> | (Optional) Enter the keyword <code>vrf</code> followed by the name of the VRF to enable debugging information on ISIS for CSNP/PSNP packets tied to that VRF. The command displays the SNP (CSNP/PSNP) related debugging information.                                                                                                                                                                                                                                                                                                                                              |
| <b>interface</b>    | (OPTIONAL) Identifies the interface type slot/port as one of the following: <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li><li>• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li></ul> |

## Command Modes

EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Added support for VRF. Introduced on the S6000-ON. |
| 9.2(0.2) | Introduced on the Z9000.                           |
| 9.0.2.0  | Introduced on the S6000.                           |
| 8.3.19.0 | Introduced on the S4820T.                          |
| 8.3.12.0 | Introduced on the S4810.                           |
| 6.3.1.0  | Introduced.                                        |

## debug isis spf-triggers

Enable debugging on the events that triggered IS-IS shortest path first (SPF) events for debugging purposes.

### S4820T

**Syntax**            `debug isis [vrf vrf-name] spf-triggers`

To turn off debugging, use the `no debug isis [vrf vrf-name] spf-triggers` command.

#### Parameters

**vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to enable debugging information on IS-IS corresponding to that VRF. This information contains spf trigger detail tied to the VRF that you specify. When SPF is triggered, this debugging information is displayed.

#### Command Modes

EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Added support for VRF. Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.                           |
| 8.3.19.0 | Introduced on the S4820T.                          |
| 8.3.12.0 | Introduced on the S4810.                           |
| 8.3.11.1 | Introduced on the Z9000.                           |
| 6.3.1.0  | Introduced.                                        |

## debug isis update-packets

Enable debugging on link state PDUs (LSPs) that a router detects.

### S4820T

#### Syntax

```
debug isis [vrf vrf-name] update-packets [interface]
```

To turn off debugging, use the `no debug isis update-packets [interface]` command.

#### Parameters

**vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to enable the debugging information on IS-IS. This information contains updates from neighbors tied to the VRF that you specify. This command displays the debugging details of the received LSPs from the neighbors.

**interface** (OPTIONAL) Identifies the interface type slot/port as one of the following:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Added support for VRF. Introduced on the S6000-ON. |
| 9.2(0.2) | Introduced on the Z9000.                           |
| 9.0.2.0  | Introduced on the S6000.                           |
| 8.3.19.0 | Introduced on the S4820T.                          |
| 8.3.12.0 | Introduced on the S4810.                           |
| 6.3.1.0  | Introduced.                                        |

## default-information originate

Generates a default route into an IS-IS routing domain and controls the distribution of default information.

**Syntax** `default-information originate [always] [metric metric] [route-map map-name]`

To disable the generation of a default route into the specified IS-IS routing domain, use the `no default-information originate [always] [metric metric] [route-map map-name]` command.

**Parameters**

**always** (OPTIONAL) Enter the keyword `always` to have the default route always advertised.

|                                  |                                                                                                                         |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>metric <i>metric</i></b>      | (OPTIONAL) Enter the keyword <code>metric</code> then a number to assign to the route. The range is from 0 to 16777215. |
| <b>route-map <i>map-name</i></b> | (OPTIONAL) A default route the routing process generates if the route map is satisfied.                                 |

**Defaults** Not configured.

**Command Modes**

- ROUTER ISIS (for IPv4)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (for IPv6)

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.12.0 | Introduced on the S4810.    |
| 8.3.11.1 | Introduced on the Z9000.    |
| 7.5.1.0  | Added IPv6 ISIS support.    |
| 6.3.1.0  | Introduced.                 |

**Usage Information**

When you use this command to redistribute routes into a routing domain, the router becomes an autonomous system (AS) boundary router. An AS boundary router does not always generate a default route into a routing domain. The router still requires its own default route before it can generate one.

How a metric value assigned to a default route advertises depends on the `metric-style` command configuration. If the `metric-style` command is set for Narrow mode and the metric value in the `default-information originate` command is set to a number higher than 63, the metric value advertised in the LSPs is 63. If the `metric-style` command is set for Wide mode, the metric value in the `default-information originate` command is advertised.

**Related Commands**

- [redistribute](#) — redistributes routes from one routing domain to another routing domain.

## description

Enter a description of the IS-IS routing protocol.

**Syntax** `description {description}`  
To remove the description, use the `no description {description}` command.

**Parameters**

|                           |                                                                             |
|---------------------------|-----------------------------------------------------------------------------|
| <b><i>description</i></b> | Enter a description to identify the IS-IS protocol (80 characters maximum). |
|---------------------------|-----------------------------------------------------------------------------|

**Defaults** none

**Command Modes** ROUTER ISIS

**Command History**

| Version     | Description                 |
|-------------|-----------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON. |
| 9.0.2.0     | Introduced on the S6000.    |
| 8.3.19.0    | Introduced on the S4820T.   |
| 8.3.12.0    | Introduced on the S4810.    |
| 8.3.11.1    | Introduced on the Z9000.    |
| pre-7.7.1.0 | Introduced.                 |

**Related Commands** [router isis](#) — Enter ROUTER mode on the switch.

## distance

Define the administrative distance for learned routes.

**Syntax** `distance weight [ip-address mask [prefix-list]]`  
To return to the default values, use the `no distance weight` command.

**Parameters**

|                      |                                                                                                                                                                                                                                                              |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>weight</i></b> | The administrative distance value indicates the reliability of a routing information source. The range is from 1 to 255. (A higher relative value indicates lower reliability. Routes with smaller values are given preference.) The default is <b>115</b> . |
